> this type? Thanks!

The Icom 2SAT does out-of-band receive, and I think has a mod for out-of-band transmit. However, even if you are licensed to transmit in the non-amateur bands, I believe that the rigs, at least the IC-2SAT, do not meet the FCC class restrictions for transmission in the non-amateur bands. You might want to check the various rigs for FCC compliance before you buy.

1192. Re: KP for Kenwood tr2600

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 15:38:04 UTC
From: rschetge%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <581@arrlhq.UUCP>
Source record: 290966

I have a TR-2600, and a few years ago the keypad
failed. The symptom was that buttons in one column of the
pad did not work. I opened the radio up hoping to find a
loose wire that I could re-attach--no such luck.
The "keypad" is a PC board mounted directly behind the
buttons. There are several diodes (and little else) on the
board. I checked the diode closest to the affected buttons,
and it had failed. Once it was replaced with a
garden-variety switching diode, the radio worked fine. So, a
new keypad may not be necessary. I hope this helps.

73, Bob.

1193. Need Info on Oshkosh/EAA Flyin

Newsgroup: rec.radio.amateur.misc

OK everybody, we have reached the conclusion that ICOM radios are no good.

Now here's the solution.

Take that ICOM radio you have (doesn't matter what it is HF, VHF, UHF) and
put it in a box, and send it to me. I will take care of diposing of all
these garbage radios. It doesn't matter wether they are in working
condition or not. I will make the sacrifice and devote my time to
cleaning up this scourge.

I'm good in the callbook!!

1195. putting cw filter in xcvr

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 16:05:38 UTC
From: derry@NeXTwork.Rose-Hulman.Edu
Message-ID: <1992Apr20.160538.2375@cs.rose-hulman.edu>
Source record: 290969

Howdy,

When I attempted to order a 250-Hz filter for the low I.F. (455 kHz) of my Kenwood TS-690S transceiver, the salesperson (mail order) told me that if I didn't first install a 500-Hz cw filter in the high I.F., it would be worse than no filter at all.

Over his objections and promises of dire consequences I ordered the filter anyway. I installed it and it works just fine. I might insert here that the AGC voltage is extracted AFTER the low I.F. in this particular reveiver. (Why would it be otherwise?)

Don't believe everything that sales persons tell you. Maybe the guy was working on a commission.

Happy as a lark and pounding brass (actually wiggling paddles) as much as possible, Jack. K9CUN

Yep, you're right. Only one problem: they're expen$ive. Priced an IC-4KL (the full gallon version) lately? It's as much as the IC-781. We have one of each at the JSC ARC (thanks, Icom). Sure works nice, though.

Oh, almost forgot the KW antenna tuner behind it, at least for some amps (the 4KL has one built in). Solid state finals don't like mismatches. That's not a problem in the broadcast industry, since you tune it up once on one frequency and forget about it, but in the ham world, that's more of a problem.

1198. Kenwood TM-732A Extended Receive Mod

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 16:30:41 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <kv5sdhINNkrp@west.west.sun.com>
Source record: 290972

Extended Receive Mod for the Kenwood TM-732A Dual Bander

1. Unclip removable control head unit (leave wire attached).

2. Open small plastic trap door in back of control head.

3. Cut small green wire.

4. Reassemble, apply power.

This mod extends the UHF receive to 410-570 MHz. Receiver works
over full 410-570 Mhz range.

This mod also enables an 800 Mhz receive mode. To use, place radio
in VFO mode and push and hold MHZ key.

Note: My radio hears nothing at 800. I suspect that a separate
antenna connection must be made.

Source record: 290974

Correct, it would be illegal to use any sort of made-for-amateur radio on the commercial band. Ham equipment is not type accepted for commercial freq use. No commercial gear can be type accepted if the user can set the frequency outside of the legal range for the commercial use.

However, there's a loophole here. Radios such as the ICOM H-16 have no user command to set the frequency (just change channels). However, a technician can field program the radios without anything other than mumbling a magic incantation on the touch tone pad. If you show your ham license to your friendly neighborhood ICOM tech they'll probably either set up the Ham freqs you want or maybe even let you in on the magic word.

If you've only got a few ham repeaters you use, nearly all the commercial gear can be set up for the ham freqs even if it means having to be programmed with some more involved setup.

> The No-Code license allows only
> 6-meter and under; How bad is that? In short, WHAT GOOD IS MY LICENSE
> ONCE I'VE GOT IT?

I think you got confused. The technician license allows 6 meter and shorter wavelengths to be used. That's 50 MHz and HIGHER frequencies which is where most of the packet work happens.

You will need some sort of radio, some sort of TNC, and some sort of computer. Presumably you already have a computer, since you're on the net, I'll skip that. A TNC is the modem of the packet world. It's more than that actually, it also implments a bit of the protocol. Think of it as a "terminal server." This has RS-232 in and talks to the radio. If all you are going to do is VHF packet (as opposed to discussing the weather on lower frequency RTTY :-)), then you probably want to buy a simple TNC. Unless you're trying to go for small, the best bet is a TAPR TNC-2 (or clone). This is THE most common TNC on the market. There are real, made by TAPR ones, and also they are commercially manufactured by people such as AEJ (who calls it the PK88). You can usually find one used for under $100.

For a radio, you can use almost anything. I use a 2 Meter mobile rig for packet (even though it sits on my desk). The TNC connects to the microphone and speaker jacks. Again, new we're talking a few hundred dollars, but you can find older rigs without the bells and whistles for a fraction of that. You'll also need an antenna. You can by one, or build one. Simple 2M groundplanes can be had for under $100, plans are in the ARRL books.

Almost anywhere you find packet activity down around 145 MHz, plus or minus. You can give a tune around with your friends scanner to see if there is any packet activity that the propaganda allows to reach to your radio. :-)

1203. Posting in the wrong group

Newsgroup: rec.radio.amateur.misc

You have.
For the record: I do not hold it against any individual that they chose any available option to enter the ranks of ham radio.

What I wanted to protect amateur radio from are those who would turn the bands into an extension of 11 meters. Folks may snicker at that, but why has the amount of jamming and deliberate interference gone up sharply on the repeaters I inhabit in the past year?

Marco, I'll add my congratulations to those you got at your local ham club.

The last time I looked into prices for RF power transistors, they still seemed much more expensive than tubes at amateur power levels (at least in the 600 watt range). (this could well have changed in the last year, though) Granted, you don't replace transistors anywhere near as often, but I'll bet the labor cost to replace an amateur final is microscopic compared to the labor cost to replace a 50Kw broadcast final. It's also harder to bend 200A power cables than 2A power cables :-).

This may be more a question of economics than excessive conservativism. It shouldn't be surprising that hobbies have different economics than businesses.

OK, I've received enough e-mail to justify another posting. RE:MB-21 bracket not available.

HRO response was none available. AES said none is stock. Several other dealers responded the same way. A call placed to ICOM indicated that the bracket was on back order and none would be available until at least June if at all. This is still not what I would call supporting a product. Icom took my name and number and will get back me should they become available.

I also received comments that indicated the bracket was not worth the price. It's only $13.67. Has anyone seen one of these? Did they at one time really exist or has Icom padded the option list for marketing reasons?

Subject : Re: Boycott Icom
I don't think it's unreasonable for a manufacturer to set a 10
year life span for a piece of hardware. WHen you consider that
most of the CPU's you see in todays rigs are custom "one up"
efforts, the cost alone of maintaining such an inventory can
quickly become prohibitive. Besides, there's nothing stopping
you from simply picking up another 720a at a flea market and
using its CPU.

Well, yes and no. You used to not be able use the same call letters for
stations in different cities, and you can now, as long as they're different
kinds of stations...you couldn't have a KCBS-AM in both LA and SF.

And you can use the same call letters for different stations. WNEW-AM is
owned by Westwoord One, whereas WNEW-FM is owned by someone else. They
now have studios in two separate buildings and everything. They USED to
be the same company, though.

1214. The Kenwood TM-732A - First Impressions

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 20:29:19 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <kv6acvINNs7k@west.west.sun.com>
Source record: 290838

First Impressions: The Kenwood TM-732A April 20, 1992

Fred Lloyd, AA7BQ

The TM-732A is Kenwood's newest entry into the fiercely competitive dual band mobile market. It is designed to replace the TM-731 dual bander, which in its own right was an extremely solid performer.

The TM-732A (or 732 for short) is closely related to Kenwood's other late model radios like the TM-x41 series. I have personal experience with the TM-241 and the TM-741 and find that there is a good deal in common between them and the 732. On the other hand, the 732 does hit the ground running with a few new features which make it stand out from even its higher priced brother the 741.

Physical Description

The 732 is the same basic form factor as the TM-2/4/541 series mono band radios which goes to say that it is an very small package for a full featured dual-bander. The package is a bit longer, however due to the small fan mounted on the rear heatsink. The manufacturers seem to be opting for the fan instead of the heat sink these days, and my only guess is that its ultimately cheaper to produce them that way. Nevertheless, the 732 is _considerably_ smaller than the 731 that it replaces.

Like the TM-741, the unit features a removable control head. The control head's release latch on the 732 is nicely recessed on the left side of the radio making it a bit more secure and less likely to be inadvertently actuated. The latch clip also seems a lot more positive on the 732. Also, the inside of the base unit is covered by an integral black plastic panel which becomes visible when the control head is removed. This was unlike the 741 which left you staring into the exposed guts of your new radio.

The shape of the control head is somewhat different in that it is not exactly rectangular in that there is a cutout of about 1.5cm^2 where the microphone plugs in to the panel behind it. The microphone receptacle, an 8 conductor RJ-45 type, is the same as that used on the 741 and looks to be an emerging (ham radio) standard, perhaps borrowed from the cellular telephone industry. The receptacle is a part of the base unit, not the control head, and so when the control head is removed it is

rectangular except for the cutout mentioned above.

The control head displays both bands simultaneously with the first two digits of megahertz being a bit smaller than the others. The clear front bezel was thoughtfully designed to be recessed a bit, so as to prevent scratches. Now, there is a nice lip on both the top and the bottom of the case that protects the bezel.

The controls have the typical legends borrowed from the 241 and the 741 series. It is disappointing to note that the key legends are not illuminated for nighttime use.

There are two speaker jacks on the rear, one for each band with one that can output both bands. The antenna connectors are typical Kenwood pigtail style with no built-in duplexer. The same mounting hardware and bracket is used as with the TM-241.

A look under the covers reveals an impressive dual-hollowed die cast aluminum case which looks like it could withstand an air drop. The The upper hollow contains the VHF transceiver with the UHF in the lower portion. The speaker is a nice size (about 2") and sits in the upper (VHF) portion of the case. The base unit includes a third circuit board which is attached to the front and is a "mother board" of sorts which contains the base unit MPU and interface connectors. The only other circuit board is the one found in the remote control head unit.

The overall integration of the unit is impressive. My first impression in looking inside was that it was mostly empty. That's because the surface mounted components are so small and the integration so high that there are only a few visible building blocks present. There are, for example, no wires inside this box. Well, to be accurate, there are the two wires which feed the speaker. That's it. The rest of the connections are all made via printed circuit paths. There is one short, small, green wire in the control head, which when clipped enables extended receive capabilities (see below).

There are a couple of small adjustable pots inside, and these are the smallest that I've ever seen. They, like everything else, are surface mount types. I would guess their size to be on the order of 3mm square! If I were to try and adjust them, I'd probably use the eraser end of a pencil. These pots adjust the high and low power output settings as well as the max deviation.

The unit comes DTMF ready, which means that a DTMF decoder board is included. This gives it remote control ability, DTMF squelch and paging, and a 10 number autodialer. The only internal option offered is the TSU-7 CTCSS (PL decode) board ($50).

Operating Features

Kenwood has done a fairly good job at maintaining a consistent user interface between their models. Being familiar with the 241 and 741, I found it pretty intuitive to operate. Not intuitive enough, however, to venture out of the house without taking the operators manual along since they sadly omitted a quick reference card (like the give out with the 741). Unless otherwise noted, the 732 generally has the same basic feature set as the TM-241 plus several extras.

The following is an unordered list of outstanding bits of trivia regarding the 732's features:

1. Dual In-Band Receive: Competitive pressures (e.g. Icom's 2410) has now made this a standard. You can set the display to receive any combination of: VHF/UHF, VHF/VHF or UHF/UHF. This capability is quite well engineered and makes it possible to transmit as well as receive on either band's second display. It is not possible (understandably) to have a full duplex QSO on an in-band setup. In other words, when you set the radio to monitor two UHF or two VHF frequencies, one of these frequencies is muted when you transmit on the other. This is not so when the selection is VHF/UHF, where the receiving band is not muted during transmit.

Looking at the schematic, the dual in-band receive is well implemented with each of the transceiver boards having two receiver front end units (RF amp and mixers), one for each band. There are some unsymmetrical aspects to the dual in-band receive. First, the UHF receiver does not have an AM mode which means that you cannot monitor AM aircraft spectrum at 118-136 MHz with the UHF receiver. Similarly, you cannot monitor 800 MHz with the VHF receiver. Each of these modes AM aircraft and 800 MHz, are unique to the VHF and UHF receivers respectively.

A nice touch is that even though the second receiver is utilized on the other band, the transmitter is automatically switched back to the proper band which allows you to transmit on either of the two frequencies while using the dual in-band mode.

2. Smart Mute: The MUTE function is now intelligent in that it mutes the non-PTT band only when necessary. This means that the audio muting (actually, 20Db of audio attenuation) is switched into the auxiliary band only when something is being received on the primary band. Previous Kenwood rigs muted the auxiliary band at all times when the MUTE function was active.

3. More programmable microphone function keys: Previous Kenwoods allowed you to program the PF microphone key only. With the 732, you may program any of the top 4 function keys (CALL, VFO, MR and PF), even for example, with such multi-key sequences as [F][VFO].

4. New Display Lighting: The display is the now-standard black letters on a light background. Like the 741, it has 4 light levels, plus OFF (no light) which is interesting. Also, there's a special feature which when enabled makes the display jump up to the next brighter display level whenever a button or key is pressed, returning to the dim level after 5 seconds of inactivity. When used with the OFF level it gives you a display which is completely dark at night and comes on only when you need it. There is, however, a small green LED off of the display which remains lit at all times to show which band is in use.

5. Memory: As advertised the radio comes with 25 full-function, odd-offset capable memories per band for a total of 50 memories. What's nice however, is that you can have up to 64 memories if you are willing to forgo the odd-offset capability to varying degrees. For example, if you can live with only 5 odd-offsets then you'll get 30 memories per band. If you don't need any odd-offsets then you get 32 memories per band. In addition, you can apportion the 64 available slots between the two bands in whatever ratio that you desire (in 5 channel increments). In other words, you can configure for 50 UHF memories and 14 VHF memories if you like.

6. Cross Band Repeat: This is the first Kenwood radio to come from the factory with CBR enabled and documented - no mods necessary. Works in the usual way and has a built-in adjustable time out timer. The turnaround hang time is also adjustable.

7. Full remote control from microphone: There is a special mode in which nearly all functions are controllable via the keys on the microphone. Even volume and squelch are controllable. The key sequences are difficult (although no more than others) do memorize. Where's my cheat sheet !?!?

8. Remote base operation: The radio is remote controllable via another transceiver using DTMF tones. The key sequences are not the same as those used for the "microphone remote control" as mentioned above. Nonetheless, it is possible to change frequency, PL, Repeater ON/OFF, memory channels, etc. from remote. Determining your current frequency from remote base is only indirectly possible, and then only if you've got a perfect pitch ear. You can command the radio to "speak" its frequency in which it will emit one of ten documented unique tones for each digit in the frequency display. ICOM solved this in the 2410 by including a Voice Synthesizer option which will really "speak" the current frequency. There is no way to determine any other operating parameter via remote control. You must set what you want.

9. Channelized Operation: Using this mode, frequencies are no longer displayed and the VFO is deactivated. Only memory channels are available for use and the display shows CH-01,

CH-02, etc. A strange "feature" if you ask me.

10. New Squelch Features: The unit essentially has 3 squelch modes (not counting CTCSS or DTMF). There is the normal noise activated squelch and two new squelch modes - S-meter squelch and Microprocessor squelch. S-meter squelch works on signal strength instead of noise level and when it is used you preset a desired S level on your S-meter using the squelch knob. Only signals which are stronger than your setting will break squelch. The other new mode, Microprocessor squelch, is basically a full automatic squelch which disables the squelch knobs entirely leaving the internal CPU to do the work.

11. Dual band simultaneous scanning: Not particularly new but a nice feature anyway. You may continue to scan on one band while you're talking on the other. The ability to do dual in-band scanning has not been tested but should be possible.

12. Extended Receive Modes: Cutting the now famous green wire in the control head will unlock the UHF receiver which comes factory limited to 438.005-449.995. After the mod (which requires no radio disassembly) the UHF receiver will cover from 410-570 MHz. Also, an 800 MHz mode is available by pressing and holding the MHZ front panel key. The author's transceiver could hear nothing on 800 leading to speculation that it may be necessary to either connect another antenna (like the 741) or perhaps add a jumper somewhere. The schematic shows that the 800 MHz frontend is already attached to the antenna port. (Perhaps there's no 800 RF amp? -fred)

Subjective Impressions

Being a TM-741 owner, there were a couple of things that I missed on the 732. First, there's no real-time clock, no sleep timer, no programmable ON time/ OFF time feature. There is an APO (automatic power off) with a preset time of 2:59:00 of inactivity until power down.

Another complaint is the slow scanning speed. The unit will scan VFO or memory at no more than about 5 channels/frequencies per second per band. I consider this to be terribly slow in today's age. The slowness is probably due to the fact that the remote contains all of the scanning logic and because the data path between the head and the base is over a 2 wire serial data stream.

Another perennial complaint is that the radio does not cover the entire UHF frequency band of 420-450 Mhz. As shipped, the unit will only operate over the range from 438 to 450, (transmit or receive) which I find objectionable.

The manual is of typical quality and fairly complete although not well indexed. There are so many functions that a cheat sheet is needed but as mentioned, was sadly not included. In

typical fashion I note that the Japanese have never been able to adequately and clearly explain how DTMF Squelch and Paging works. They've tried diagrams and jinglish explanations but in the end you still end up reading the instructions over and over before you fully understand them. I'd love to see a plain English discussion of how the DTMF features are intended to work and how they really work in practice. Follow that with a step by step example and we'd probably have something that could be more popular.

One of my reasons for buying the radio was to use the remote mounted head option. The option, the PG-4K kit, is advertised as a 13 foot extension. What you don't find out until you buy it, however, is that only the display cable is 13 feet long and the microphone cable is only half that! To me this meant that although the display cable would let me trunk mount the base, there was no way I could get by with a 6 foot microphone cable. The solution: buy the PG-4M(?) which is the longer model for another $30! Needless to say, I'm not a happy camper! Are you listening Kenwood????

On a positive note about the remote cabling, at least with the 732 it is possible to roll your own. The 4 conductor head to chassis connector cable could be easily spliced and extended, and an ordinary RJ-45 extension cable could be used for the microphone. For many folks, however, it's probably easier to just buy the short ($47) or the long ($78) cable kit.

The extension cable issue aside however, it still looks like it will be a very good radio. As always, after spending a big wad of cash I'm automatically inclined to say that I like the radio. This is no exception, the TM-732 does a fine job at heading off the competition at a good price-performance point. The price is the same as the older TM-731 which was around $650 retail (real price, not the bogus MSRP).

To conclude, I think Kenwood has come up with a fine replacement for the 731, and has put a lot of thought put into the design of the 732.

See you on the air...

1216. AEA's DSP2232

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 20:58:46 UTC
From: n4hy@idacrd.UUCP
Message-ID: <1261@idacrd.UUCP>
Source record: 290840
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

At long last, the fully operational software is onboard the DSP2232.
It does everything promised and more: It does two ports simultaneously
with several modes paired. I am given to understand that the owner
of LL Grace (and manufacturer of the DSP-12) has been telling people
all over the world that the DSP2232 would never support dual ports as
there wasn't enough time on the DSP chip. Hogwash. The chip has 50% of
the ticks free when running a VHF modem on one port and HF modem on the
other. At this time I am working on getting two 9600 bps modems to
run. There the timing of events is critical. Each radio side has to
be serviced at 76400 samples per second. With a trick I can do with
one of the unused chip selects, I can see what kind of time the program
spends in the idle loop. It is also spending less than 50 % of the time
doing real work. However! There is extra overhead in servicing two different
radios at once. BEFORE YOU BUY A Multimode controller of any variety,
consider this box. It is definitely the most capable at this time. If
you are going to the Dayton hamvention or to the LA hamvention, you will
be able to see all the toys displayed. The modems onboard the last ROM
I shipped:

Packet:

HF 300 bps, Bel202 1200 bps (both standard packet modes), 2400 bps
(KAM 2400 or AEA PK-90 standard), PSK 1200 and 4800 bps, PACSAT modems
at 1200 and 4800 bps, MSK at 1200 and 2400 bps, K9NG or G3RUH at 9600 bps.
I have implemented a decision feedback equalizer in the G3RUH modem which
GREATLY improves the copy of UO-22 for example. The dual port modems
in the box at this time are HF 300 bps and VHF 1200 bps packet, two
VHF ports, and baudot/amtor and VHF packet (what??? yes apparently this
would be very popular with the DX cluster folks, we'll see). I am working
on two 9600's side by side. Stand by for further news on this. On the
dual port stuff, the host side software is FULLY operational. I monitor
two channels at once without aid of special software and gateway from one
side to the other is as easy as digipeating via the gateway call sign.
(Look out KAM). We will support ALL HF modes paired simultaneously.

Baudot/AMTOR

There is every conceivable shift and tone pair and your favorite is not
there, it is only software. I regularly copy 170/425/ and 850 Hz shift
stuff listed in the listening times. There work as well as the PK-232
and can be made better when I have more time.

Miscellaneous:

Morse:

This turned out to be quite an interesting exercise. I did a neat trick that improved the performance of this demod over most that do morse. The real problem with others morse demods is that they are compromises; add ons as an afterthought because you cannot have a multimode without morse, etc. This modem is killing an ant with an atom bomb, great filters, great algorithm for detection, etc.

Grey Scale Fax, and SSTV:

I implemented grey scale WEFAX, APT, and SSTV demods. I wrote an application to display these. The application needs work, the demods do not. If you are not looking at the weather charts or the sat photos, you are missing a fun thing. This box makes it easy. The standard will be made public so that others can do a better job than I since I have little interest in supporting such an application. The basic operation is quite simple: Data is sent out as 8 bit pixel values, this is frequency for the WEFAX and SSTV or amplitude for APT. There are several people working on the application for AEA and this has not all crystallized but the basic functionality is there.

Spectrum analysis:

I did a 512 point real valued FFT (using the old trick of doing it with a 256 pt complex) and then formatted the data to be sent out the serial port. This is displayed with an application I wrote. It is pretty neat to have amplitude and phase plots for you receiver looking at both known and unknown signals.

Automatic Gain Control:

There are several modes for which this is a must, there are several modes for which this is a bust (PSK from AO-16 for the former and WEFAX-APT for the latter or morse for examples). There is a no compromise attitude with this now. It drastically changes the performance of the modems. The modems are now stored with AGC state settings in them. There are several different AGC settings, off, on, more on, different time constants for attack and decay, etc. This was a brilliant piece of retro engineering for AEA by Al Chandler and it fits right into the existing units. If you have not gotten this retrofit, it is now an absolute must. Call them up and they will be happy to do it. By the way, if you have an application for which you do not want AGC or wish to provide your own, you can change the AGC from the command line.

DCD thresholds:

DCD thresholds are set from the command line. For those modems which operate on coherence of carrier detection or coherence in the data detection, you need to set the threshold for your radios. This is done via the command if you find that the default setting is inappropriate for your lash up.

Experimenters kit:

Many have asked me when and whether there would be an experimenters kit (you can download modems you write to the unit). I cannot give you an

exact date. The fully operational stuff has been delayed enough that there has not been enough time to even think about it. Now that the major hurdles are behind us, we can begin to work on this in earnest.

The bottom line is that the unit is fully operational, and to my mind, it now exceeds what I thought its potential would be. This is a function of my having gotten better at DSP and the folks at AEA (Steve Stuart and Al Chandler) working very hard with me. For those of you with the units already, it is about to get amazingly better.

Stop by the AEA booth in Dayton and see it.

Bob McGwier, N4HY

1217. Also want mods for Kenwood TH-77A

Newsgroup: rec.radio.amateur.misc

Does anybody out there have any "soft" modifications for the W2A? I only recently discovered that by pressing light/b/# when the power is turned on, the wide-range receive is enabled (i.e. more than what is listed in the literature) and I can receive from about 120 MHz up on VHF and all the way into the 900's with UHF!!!! Anyway, if there are any other such "modifications" please let me know. Thanks.

1219. Why don't they advertise DAYTON in Dayton?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 21:37:58 UTC
From: 1843eip@hickam-emh.af.mil

Source record: 290843

As part of my impending move to Dayton, I've been reviewing various information packages sent by real estate agents eager to separate me from my hard-earned greenbacks in return for their services (uh, and a house, too, I guess ;-)). Included in these packages are assorted books, flyers, pamphlets, etc., describing all the fun things to see and do in and around Dayton. I searched these items for any mention of the Most Important Event of the Year (coming up this weekend), but what do I find.....?

Zip. Zero. Nada.

Come on, folks! The biggest hamfest in the Western Hemisphere, and it's not even listed....but somehow things like "Druzhba Soviet Dancers" and "Dan Emmett Dog Show" get listed! No kidding, those are real events (both on 10 Apr, BTW).

This is what I mean when I say we have absolutely shitty PR...someone moving to Dayton would have no idea that the largest ham event east of the International Date Line happens right in town.

Damn shame.

BTW, I'm planning to go to DAYTON this year for the first time, as part of my house-hunting trip. I'll be wearing the standard ham uniform (yellow call-sign baseball hat, mis-matched shirt and shorts)...say hello if you recognize me (I'm the one with the tan ;-)).

73,
Jeff Miller NH6ZW AFA8JM
1843eip@hickam-emh.af.mil / nh6zw@uhm.ampr.org

Only 16 days left in paradise...then it's off to Dayton (quasi-permanently)!

>What I wanted to protect amateur radio from are those who would turn the bands >into an extension of 11 meters. Folks may snicker at that, but why has the >amount of jamming and deliberate interference gone up sharply on the repeaters >I inhabit in the past year?

I've been monitoring the local repeater activity on 2-meters and 440 for about the last month (I got a rig very shortly after I passed the test specifically to start listening; I was told it was a good way to learn about local practices before getting on the air), and I haven't noted the same problems you mentioned. It's unfortunate that things in your area have gone downhill since the introduction of the no-code tech class. As you saw in my original article, the new class does not seem to have had the same impact on amateurs in my area.

>Marco, I'll add my congratulations to those you got at your local ham club.

Thanks!

1223. Re: How many green stamps with some QSLs?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-20 22:29:39 UTC
From: sharon@unixland.natick.ma.us
Message-ID: <1992Apr20.222939.17538@unixland.natick.ma.us>
Source record: 290847

dstock@hpqmola.sqf.hp.com (David Stockton) writes:

> It always seems unacceptable to me that one station of two in contact should
>be EXPECTED to pay for both cards and both postage. When confronted with "send
>$2/whatever for my card" I make a point of relying that my card costs $XXX
>and that I only QSL on receipt.

In theory, I agree. In practice, someone who lives in a rare, desirable
location could end up spending LOTS of money printing up and sending
out QSL cards.

> I always QSL, at my own cost, if the other station requests a QSL. Direct.
>but I will not pay the other station's QSL costs. If he wants to send me a card
>I'll be happy. I just consider the radio bit to be more important than the
>postal bit. Be insulted if I ever ask you for a QSL, it will be because I
>want confirmation because of suspected piracy !

If someone sends me a QSL card direct, I'll usually send one back direct
whether or not there's return-postage included. However, I'm not exactly
bombarded with requests, so it's only a few dollars a year. And I do
greatly appreciate it when those who want my card for a YL award include
postage and a return envelope.

Keep in mind, too, that in some places in the world postage is much more
expensive compared to salaries than you or I may be used to. In Estonia,
for example, postage was just hiked up to *40 rubles* outside Europe.
I would never expect someone to fork over that kind of money just to send
me a card.

In some countries, the bureau system has broken down (some places in
E Europe), and the only way those hams can get cards right now is direct.
Considering how tough the economic situation is, many can't afford to pay
postage for all the people who want cards.

If a request for direct QSL card with green stamps seems somehow out of
line to me, then the heck with it -- I don't ask for the card. As much
as I'd like to get some awards (DXCC, 100 oblast), the most important
thing for me is to enjoy the hobby. I agree with you that working on the
air is more important to me that "the postal thing." ...

Source record: 290850

In this discussion, I think it's important to differentiate between custom chips like ASICs and more generic stuff like crystal filters. Linear amplifiers don't require any state-of-the-art parts, so they don't really count, either.

Nowhere in this discussion have I seen what hams would be willing to pay for long-term serviceability. Keeping parts laying around in bins at the factory warehouse costs big bucks. Are you willing to pay the additional 10-20% ? TANSTAAFL.

Hams are so notoriously cheap that any major manufacturer is going to go for low cost above all other considerations. That means cutting corners by using custom VLSI and scrimping on after-sale support. Hamdom, you made your bed, now lay in it.

If you want indefinite support, buy stuff that only uses off-the-shelf parts. Be prepared to settle for 1970s technology.

No, you don't have to make the contacts over again. As long as you make
all DXCC contacts from the same DXCC country, they are valid.
Yes, a W2 living in W1 still gets the QSL cards from the W2 bureau.

Or, if somone needs the "magic word" to program the Icom IC-H16 or IC-U16 (VHF-Hi and UHF), they can mail me at rosty@rat.csc.calpoly.edu and I'd be happy to send the info.

I'm sooooo tired of the "you can't do that!" answers when it comes to mods I'd be happy to share whatever info I have on those two radios (I own a U16, and programming is identical to the H16).

BTW: Icom has been GREAT to me in regards to service. ALthough I'm not yet an amateur, I'm so thrilled with their U16 land mobile radio, I'll definately be buying amateur gear from Icom (got my eye on a W2A).

1230. Re: Seeking Information on VOX Headphones for ICOM IC-24AT

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-21 00:37:45 UTC
From: bweaver@quack.sac.ca.us
Message-ID: <fL0SQwn@quack.sac.ca.us>
Source record: 290854

I use an Icom Vox headset on my bike with my W2A. Looks like
pretty much the same unit they sell for the 24AT. The headset
works great, but as for VOX, forget it if you are going to be
working repeaters with it.

The problem is, when you want to key up, you need to make some
noise to key up the radio, then wait a few moments while the
repeter comes up before you can start talking. If you just put
it on vox mode and start talking, the first 2-3 words will be
cut off.

The second problem is, if you pause at all while you are talking,
the radio unkeys, and once again words are lost and people you
are talking to are annoyed.

I would think vox should be fine for simplex, but you be disappointed
with the performance if you use repeaters.

Ok, yeah, I heard that there might be some sort of illegality in doing this mod, and this confirmed it. Thanks...but I do have one more question..

Is there at least a MOBILE radio existing that can have the offset programmed? I am in need of changing around the offset, the radio which I have (2SAT) only has offsets in like every 5mhz or something like that, I need to input the offset on my own instead of just using the radio's selection.

Any ham mobile do this?

From: scotts@petrus.Berkeley.EDU
Message-ID: <svprdINNg8i@agate.berkeley.edu>
Source record: 290857

A friend of mine and I are working on building a 450 repeater. We've acquired a reasonable pair of RF decks, and a "mobile" set of duplexers. We're interested in the possibility of building a "real" duplexer for 450. There's an article in the "old" ARRL book for a 144 MHz set, but all it gives are "magic" numbers. No dimensions in terms of wavelength. Is both radius AND length a factor? Has anyone built a 450 duplexer from scratch or modified the ARRL design? I'm interested in hearing.

Thanks,

I once heard a US station calling "CQ Africa". A station signing "5U4GB"
came back to him. The US ham answered exitedly ("Wow! A new one!"), but
the "DX" station never came back again. The US ham was still desperately
calling 5U4GB when I happened to tune back across the frequency
5 minutes later.

>
>I don't think it's unreasonable for a manufacturer to set a 10
>year life span for a piece of hardware.
especially when no manufacturer need support equipment for that long after it's demise. However, I believe there are laws in the US, depending on the product that require that parts be maintained for 3 to 7 years after product cancelation. I know of no such law in Canada (where the original article was posted).

< WARNING, USELESS ANECDOTE >
I owned a Chrysler Lazer, a Canadian made version of the Dodge Daytona. Within two years I was forced to buy parts in the junk yard as Chrysler had stopped maintaining a stock of parts. The parts were listed as discontinued and no longer available. No crosses !!! (Four bolt wheels, rather than five, putzy 2.2 Litre rather than balanced shaft 2.5, etc.)
< ANECDOTE FINISHED, UNCOVER YOUR EYES >

>WHen you consider that most of the CPU's you see in todays rigs are custom
>"one up" efforts, the cost alone of maintaining such an inventory can
>quickly become prohibitive. Besides, there's nothing stopping you from simply
>picking up another 720a at a flea market and using its CPU.

Ya, but the less complicated designed rigs can be maintained ad-infinitum (heck, even toob type) without resorting to scavanging. I do NOT believe that the complications of the CPU should be used as an excuse by the manufacturers. If they want to produce a product, they MUST account for the cost of this inventory in their price of sale.

However, 10 years is a LONG time. The engineering company I work for maintains stock of parts back to 1978 (14 years for you mathematically illiterate). Know anyone that wants to buy a set of 11/2 boards? :-) :-)
A company as big as ICOM certainly must have the depth to maintain parts for that long, before resorting to stupid `grandpa is dead' excuses !!!

|>I vaguely remember reading an article a long time ago that said that there are
|>two different ways of timing an iambic keyer's dot/dash insertion. I know that
|>the timing on my keyer (a Trac) is much different than my friend's MFJ and
|>neither of us can easily use the other's keyer.
|>Can anyone point me at an article that describes the two keyer timing methods?
|>Thanks.

Maybe you're thinking of Curtis "A" and "B" style keying? In "A" style, iambic operation ends on whatever element (dit or dah) that was sounding when you let go of the paddles. In "B" style iambic operation sends one extra element after you let go (e.g. if you were sending dah when you let go of the paddles it completes the dah and sends a dit then stops.)

The only "article" I know of on the subject is the data sheet from Curtis on their keyer chips.

1244. AEA's DSP2232

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-21 12:46:45 UTC
From: MOSIER%UNCG.BITNET@ncsuvm.cc.ncsu.EDU
Message-ID: <692AADB27BDF201D3F@uncg.bitnet>
Source record: 290868

To Bob McGwier, N4HY (or anyone else):

You posted something on AEA's 2232. It would appear that you are a software (?) developer and are working hand-in-hand with AEA on the 2232. But being ignorant of these things, and wondering whether I should spend this much on a 2232 vs. a PK232 to get on digital modes for the first time -- and further wondering if I can even make a 2232 work at all -- TELL ME: who are you? Are you producing software for AEA that they include with the 2232, or are you a third party vendor selling your own? Or, being a digital-modes-beginner, should I not have read your post (I really didn't understand most of it)?

Sitting in front of this computer hooked to the internet during the day, I've never had much desire to then go home and sit in front of a computer hooked to my radio during the evening -- I'd rather sit in front of my keyer. But I'm beginning to feel left out. On the other hand, I see newcomers going through the learning curve with the PK232, and I look at N4HY's comments on getting the 2232 up and running, and I get the idea that beginners should let the 2232 develop for a year before picking it up. Or does the 2232 work just like a PK232 at the elementary level, and then do more when you learn how?

Comments?

Well, until 2 weeks or so ago, my everyday rig was a Yaesu FT-101. I bought
it new. In 1973.

My "new" rig is a Kenwood TS440SAT, which is a 5-6 year old vintage. If I
couldn't get it repaired I would be mighty peeved.

1246. FT2400H - a Review.

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-21 12:55:12 UTC
From: pjml@unixa.nerc-swindon.ac.UK
Message-ID: <49401.pjml@[139.166.142.1]>
Source record: 290870

Here's some of my thoughts on the FT2400H.

Construction
~~~~~~~~~~~~
A Diecast chassis is a good mechanically stable basis for any design; the FT2400H has a nice big solid chassis, with the circuitry mounted on either side. Chassis is finned to the rear to act as a heatsink. The top and bottom covers are made of plastic (though there is a screening plate screwed over the RX strip).
The front-panel is another plastic moulding. Shame they couldnt have made this diecast (i am turned on by the feel of crackle-finished alloy).

Antenna socket is SO239-type. I prefer 'N' but like nobody fits 'em to 2-meter radios. The antenna socket is slightly recessed into the back fins of the heatsink; if an angle-type PL259 is used, this makes it possible to fit the radio in a hole not much deeper than the radio itself.

Power-lead is wired permanently into the radio, there is about a foot of 'pigtail' with a fuse in it, then a dual spade-connector plug to attach the rest of the cable. I would have preferred a chassis-mounted plug/socket, but nothing is perfect.

Mic. lead plugs in the front through an 8-pole RJ45-type telco connector. There is de-emphasised audio available on one pole of this connector so 1200-baud packeteers can plug their TNC into the mic. socket without having to have a separate lead to the extension-speaker socket as well.

Controls - the tune knob serves many functions. Normally it either steps through the memories, or tunes through the band in steps. The knob is also used to select the channel-step size, the CTCSS tones, and to enter characters with which to label the memories. It is alsoused to enter the repeater offset frequency. The knob is a shaft-encoder and so has little 'feel' to it. Until you are used to the feel, you can find yourself overshooting quite easily because there is only a very feeble 'click stop' to the control. Vol. and squelch controls are as you would expect them to be; squelch is slightly smaller, so you can find it by touch in the dark.

The LCD display is well illuminated for night-time use, but lacks visibility in bright sunlight. Is this a failing common to all orange LCDs?
Ability to label the memory channels with up to 4 characters (A-Z, 0-9, space, underscore, asterisk) is rather nice; this can be done on a per memory basis (so some memories can show letters while others show frequency).

Inside, extensive use is made of surface-mount devices, many of which are not labelled. The schematic diagram supplied does not show the placement
~~~~~~~~~~~~

of parts on the circuit-boards, so identifying individual components is difficult. There are some component identifications silk-screened onto the surface of the PCBs, but this only applies to the larger parts such as coils, transformers and integrated-circuits. Surface mount resistors etc. are unlabelled. I would not like to have to fault-find on one of these!

The production of bleeps to confirm operations can be disabled. An internal potentiometer defines the loudness of the bleeps when these are enabled; the ability to easily turn the bleep off is most welcome!

Scanning
~~~~~~~~
You program two special memories (L and H) with the lower and upper scan limits, then hit the UP or DOWN buttons on the mic, and off it goes. When it finds a frequency, it can either halt permanently, or stay there for five seconds before resuming the scan. If you hit the PTT switch when it has halted, it will not resume scanning after the five seconds have elapsed.

Each time it halts, a bleep-tone is sent through the speaker if the tones feature is enabled.

RF Performance.
~~~~~~~~~~~~~~~
My trusty Bird showed 58 watts output with a 13.8 volt supply with the radio on high power. Medium and Low power gave 22 watts and 7 watts respectively. Internal potentiometer adjustments allow the adjustment of low and medium powers as necessary. On high power, 10 minutes key-down into a dummy-load made the heatsink too hot to touch. It therefore fails the 'G6WBJ 10-degree-rise' test. If the radio were installed somewhere with limited air circulation (most in-dash mobile installations fall into this category) a fan may be a good idea.
A spectrum-analyser showed all spurii to be 60dB or more down on the carrier, irrespective of the power setting.
There is no SWR-sensing circuitry on the output of the TX. I take this to imply that the power output module is safe into infinite SWR, though i do not have the courage to unplug the antenna and tape the PTT switch down...

Receiver sensitivity was, subjectively, about average. No problems were experienced with blocking or intermodulation (despite having around 300 millivolts of signal at the antenna from a local FM broadcast station). With an external 4-ohm speaker, there was adequate audio output for use in a noisy vehicle.

Extended Coverage.
~~~~~~~~~~~~~~~~~~
As delivered, the 'UK' version of this radio has its coverage limited to the European 2-meter band (144-146MHz). There are six solder-pads on the microprocessor board; judicious experimentation got me the ability to program RX frequencies in the range 118-174MHz and TX frequencies from 130 to 174MHz. Also, certain combinations of jumpers got me frequencies
~~~~~~~~~~~~~~~~~~

in the 430-450MHz range displayed on the LCD. Clearly the same control/ display logic goes into a 430MHz or dual-band version of the radio.
118-137MHz is airband - they use AM there; So even though the LCD S-meter was going hard across the scale on some signals, recovered audio was minimal (thinks: next step - build an AM demodulator....).
On TX, the RF output fell off quite dramatically outside the 140-150MHz segment. A quick look at the schematic shows why; the driver stages have L-C tuned circuits with fixed tuning (unlike the receive stages that have varactor tuning).
In the end, I programmed the scan memories to allow the thing to scan between 140 and 174MHz; no point having it stopping on unintelligible air-band AM signals.

A Glitch!
~~~~~~~~~
Normally, the memories are maintained in the absence of external power by means of a lithium cell. However i discovered that if you remove external DC power while the radio is switched on, the memories get trashed. My normal mobile installation has all the radios powered through a big relay, that is energised by the ignition-switch; i am in the habit of leaving the radios on all the time, and letting the relay take the strain. Doing this with the 2400 loses your memories. Most odd! So remember to switch the radio off before turning the engine off....

Overall Impression
~~~~~~~~~~~~~~~~~~
A nice radio. Robust, with User-friendly features (for 'User-friendly' read 'usable without reading the manual'). Theres plenty of RF output, but not enough heatsinking to handle half-hour-transmit RTTY sessions. Wide band coverage on receive does not seem to compromise resistance to intermodulation. TX is clean. I like it, despite costing 350 pounds sterling (including our equivalent of sales-tax!!).

The requirements, I believe, are that all the contact must be made from
the same DXCC country. W1 and W2 are both in the same DXCC country so you
won't have to start over.

>I think the answer to this next question is yes, but I'd appreciate
>confirmation. Even though I'm a W2 living in MA, my incoming QSL bureau is
>still the W2 bureau, right?

Yes, the foreign stations sending cards to the bureau probably are not
even aware that MA is normally W1.

Why do all the radio stations on the East coast have four-letter names starting with W and all the stations in the Rocky-Mountain area names starting with K. Why only four-letter abbreviations anyway? (It's probably so simple it isn't even in the FAQ!)

Martin.

>>but I will not pay the other station's QSL costs.If he wants to send me a card

I consider it a duty to help pay for a DX's QSL card and postage in a small manner. I always send a green stamp with my QSL cards to other countries. If someone is kind enough to put up with a screaming pileup, working as many hams as possible, buy the QSL cards and spends hours filling them out. Then I can help him at least with his postage and the cost of his cards. Let's see, for us it costs at 50 cents to mail a card out of country and the cost of a QSL card is about 3 cents a piece or there abouts. Multiply that by 1000 and you get $530. Make yourself a rare DX and the number of cards that you have to send out skyrockets way above that. Can you stand that kind of expense month after month? I don't many that could or would.

73!

1251. RE:Kenwood TM741A Mods causing problems??

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-21 14:30:16 UTC
From: tstader@attmail.COM
Message-ID: <9204211429.AA04761@ucsd.edu>
Source record: 290875

Geeezzz.... I am on my SECOND TM-741A and having the same problems that I with my first radio.... it is OFF FREQUENCY!

The other day.. the New England HRO store had the Kenwood people in and I asked them about the problem. They were aware of a faulty xtal osc that would drift. He said that serial numbers beginning with 306xxxxx and above were ok. So out of 14 some radios HRO had in stock... I got 30600134. HRO exchanged with me right on the spot, no questions asked.

Thinking that I would be all set, off I went home to re-install my new radio.... guess what! Not only is the radio 5Hz off after it warms up. This one just drops out of transmitt and receive while still showing the frequency in the window. It's not like the radio just quits, powers down or anything.... people tell me it just stops xmting. It is a little un-nerving to let go of the mike key and hear people talking. I have timed out my fair share of time-out-timers... but that definetly is not happeninh here.

So I guess it is back to HRO.... but I sure am not going to pick out any radio with a serial number less than what I got the second time around! I would hope to beleive that HRO would send back the radios that Kenwood says have a problem with the osc and get replacement units. I would hate to think of all of the un-wary buyers out there.

I don't want my moeny back.... I really like this radio... I just want one that works! Anyone elese having this problem.. or have earlier serial numbers and NOT have problems?

>Gary KE4ZV

Thanks for the hints...I think that this must be a "high power" unit. It has
a high/low power switch on the top and the PA module was connected via
a hex bolt and heat sink compound to the speaker grille which acts as a
very large heat sink. Assuming that this is the power amp, I assume that
the crystals must be on the same board that the PA plugs into. There are
4 modules on the board in addition to the PA, which are soldered in, and one
small plug in pc board. The pc board has 5 xisters, and a handfull of
resistors, diodes, etc but no xatls. Of the other four modules, one has
two tuning slugs in it...The other three are unmarked and have no tuning
holes. On the other side of the unit are two boards. The larger of the
two is connected to the mother board by nine pins on the mother board and
two 8 conductor circular plugs which connect to the mother board via a
bundle of wires. The top third of the board is mostly those \
retangular modules. They are all soldered in and have long serial
numbers on them starting with 19 or PL19. The middle third of the
board is taken up by 8 RF xformers/tuning coils/whatever. The bottom
third of the board is mostly empty. There are spaces for 6 more of the
"modules" and they are numbered 3-6. There are also two empty module
spaces on the top of the unit numbered 1 and 2. The second module has
3 of the modules and a trimer cap on it. It also has an 8 pin plug which
is connected to the mother board and two 7 pin linear sockets which were

not connected to anything. The only thing I could find resembling a
PE number was a handwritten note on a little stickon label. It documented
a modification made to the radio and referenced the PE65 modification.

Anyone have a clue as to where I could find a manual for this beast?
.

No exact references, but in one of the last couple of QST (unless it was 73), there were some stats published for AR as a whole as well as the month of December, which was touted as 'typical'. We've got about a half-million hams now, we're growing at 10(?) percent a year, and about 5 percent of hams are codeless techs. I'd sure like to see the complete numbers plotted out, with some kind of guess as to how many hams are "licensed but inactive". I run into people all the time who are "LBI". I wonder if you could deduce it from numbers of renewals.

>and attention to build properly, something I did NOT expect from Heath.

Actually the 1/2 wave technique requires very little care to build. All one has to do is measure accurately. What requires care is the selection of a coax that has reasonably stable characteristics (which Heath didn't do) and a design that does a credible job of preventing oscillation (which Heath also didn't do). Remember a transmission line that is 1/2 wave at 146MHz is 1/4 wave at 78MHz! (and 3/4 wave at 234MHz...). Since the amplifier has a good amount of gain, and is active at all times, it has a tendency to oscillate at these frequencies. And more importantly, it has a tremendous tendency to oscillate at frequencies where the transmission line's length is of no consequence! (eg. dc-20MHz). The HA-201 likes to oscillate at all of these frequencies.

Source record: 290781

I am still using old tube (that awful word:-) radios. For what I am using my radios for, they suit my needs just fine. I am not on the air enough to justify spending $$$$ for a new modern radio... So, as long as I can keep my old trusty Heathkits running, I plan to keep using them (forever?).

Now, on the other hand, consider this: I built my Heathkits (SB-301/401/220) new 20+ years ago. My cousin, who is just starting out is facing the following decision:
1) Does he buy some older (tube) radios to get started with and upgrade later as his needs require, or,

2) Does he buy a NEW digital radio and "keep it for 20+ years" - like I did?

I am trying to convince him that the shiny new ICOM/Kenwood/etc radio that he buys today most likely will not last 20 years. :-(

With a little TLC, I see no reason why my Heathkits should not still be running 20 years from now :-) About the only thing I see as being a "critical failure point" is the LMO/dial. Everything else could be replaced with standard/adapted parts one way or another. The question will be - Will it be worth the time/effort/money to keep them going?

I will address that problem when something fails.

I'm preparing for a No-Code Technician license (Somehow I just can't get up to 5 WPM solid...)

Don't let that scare you Ben. I actually passed the 5, 13 and 20 wpm exams using the "Wheel of Fortune" approach. You just grab all the letters you can and then attempt to make sense of them after the fact. IF Y_U C_N RE_D TH_S YO_ C_N DO IT. The test will ask about things like "Where state did the sending station visit?" If you've copied "V_SI_ED __RTH DAK__A" you can probably figure out the answer.

Personally, I'm neither a booster nor an opponent of the CW requirement. I can do it, and almost all of my HF work is done with it, but if I really wanted to get a lot of information communicated in a timely and accurate manner, I'd use some kind of digital mode with automatic error detection/correction. I see the CW requirement as something that requires work and seperates those willing to work toward something from those that aren't. I think a better test would be to require some other kind of work that had more universal application. It would still segregate the workers from the non-workers, but the skills picked up from that exercise could further the hobby more than the CW skills do today.

Good luck Ben, whatever you choose.

Could someone please send me information about battery clips for Yeasu HTs? I noticed someone posted here saying he got them for $5 a piece. The message has already been erased here. Could you please tell me where you got them?

Thanks,
Bryan

> You posted something on AEA's 2232. It would appear that you are a software
> (?) developer and are working hand-in-hand with AEA on the 2232. But being
>

I am one of three people who designed the unit and I am responsible for all
the DSP software that is in the current unit. This will likely change in
the future. At $12 per unit sold, I don't get enough to do this for the
remainder of my life.

> But I'm beginning to feel left out. On the other hand, I see newcomers going
> through the learning curve with the PK232, and I look at N4HY's comments on
> getting the 2232 up and running, and I get the idea that beginners should let
> the 2232 develop for a year before picking it up. Or does the 2232 work just
> like a PK232 at the elementary level, and then do more when you learn how?
>

The unit functions exactly like a PK-232 in the command mode with the
exception that there are many more modes, and many more modems. If you
do not care for doing satellites, slow scan television, spectral analysis
9600 bps packet, any baudot modem in existence, then maybe the DSP2232
is not for you. At the current suggested price of $800, it is clearly
not for every ham. The PK-232 does a wonderful of HF packet, Baudot
(narrow shift), and HF-WEFAX charts. It does a so-so job of VHF packet,
morse, and wideshift baudot. Some people hate the PK-232 interface.
If you hate that interface, you will hate the DSP2232 interface since
it is basically the same human interface.
> Comments?
>
> steve - W3GRG

If you can get to a large show, look at the box before buying one. It
may not be for you. If you cannot, wait until you see comments now that
the first major (and I do mean major) software upgrade has been installed.

Mu understanding is that it is the largest convention of any kind in the state of Ohio.

I think it's because the locals (non-ham types, and even a few of the hams) HATE the hamvention. Thousands upon thousands of hams.....

I have been told this from several locals and business owners in the Dayton area. Also, a lot of businesses (especially hotel/motels) LOVE to take advantage of the situation by jacking up their rates at the last minute even after a "confirmed" reservation with a confirmed rate.

But I'm STILL going. See you there!

>lose most of our bands and what ones are left to us will be taken over
>by the CB'ers.

CBers are really a threat. We feel it now also here, as CB boom begun two years ago. It is much worse than elsewhere, because it's harder to get a telephone than a CB - so many people are are buing it as a telephone substitute, and State Radio Agency in fact can't do nothing - they even can't enter someone's house without his permission to stop illegal transmisions.

As CB became more and more crowded there are more and more pirates on VHF - especially in the 130 - 172 range (Air, Hams, Ambulances, Police, Raillway etc.). We - hams - decided that we will defend ourselves - and some hams here are RDFing pirates and trying to get them QRT.

Anyway - I think that CBers are our enemies in many ways and that we should be supporting every move leading to destruction of CB.

1265. Why does SWR read "negative"???

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-21 16:52:08 UTC
From: rossi@gvlf8-m.gvl.unisys.com
Message-ID: <1992Apr21.165208.18447@gvl.unisys.com>
Source record: 290789

I recently acquired a used Heath HM-102 Wattmeter/SWR meter. It appears to have been constructed properly - everything looks OK.

I went through the calibration procedure and it reads perfect 1:1 SWR on my dummy load. Power output readings at 100 watts match my Bird wattmeter. The Bird wattmeter also shows perfect 1:1 SWR on the dummy.

With some of my antennas, however, the Heath meter reads "negative" SWR. The meter goes slightly "negative" in the SWR position.

I am certain that the antennas are good. They show reasonable SWR on another SWR bridge, the Bird wattmeter, and they work/load just fine.

Is this a common "feature" of the Heath wattmeter? On some bands/antennas I will get normal "positive" readings on the Heath meter but they usually do not match the other meters.

???

>ONCE I'VE GOT IT? From what I've read in "Now You're Talking", hams seem

I can sure understand the bewilderment of a newcomer to the Amateur
Radio Service, Ben! But fear not:

The Technician class of license would -- without a doubt -- provide you
with an absolutely IMMENSE amount of capability. Worldwide-and-beyond
capability; more on that later.

Remember, even the "codeless" class of Technician license gives you
operating privileges on BEJILLIONS of frequencies.

It gives you FULL amateur power level capability.

It gives you INCREDIBLE leeway in the amount of experimentation you
can do.

It gives you ASTOUNDING amounts of public service communications
capability for your community, to the benefit of your local, State
and Federal governments.

Finally - and perhaps most important to most amateurs -- the Codeless
Technician license offers you Amateur Radio communications to every
continent on the planet (and beyond, given that many Soviet Cosmonauts
and U.S. Astronauts are licensed amateurs...).

Oh, there's much more. I could tell you about working Botswana
yesterday afternoon by transmitting on 437 MHz with 10 watts of
power. I could babble on about working thousands of amateurs
worldwide, with all my antennas being SUBTERRANEAN, BELOW GROUND.

But I won't...

Dig in, Ben. You'll LOVE it!!

>ONCE I'VE GOT IT?

Very good indeed! You'll have access to the huge amount of activity on the VHF and UHF bands: repeaters for chatting with friends or getting involved with public-service communications, packet radio, satellite communications, direction-finding contests ("fox hunts"), etc., etc., etc.

>From what I've read in "Now You're Talking", hams seem to spend all
their time talking about the weather
>It would seem to me that simply making contact after contact (CQ CQ

Don't worry--the scenario you outline is extremely unlikely. Phil almost never gets on the air. :-) :-)

>The only thing which immediately grabs my interest is packet
>6-meter and below bands?

About $125, and almost all of them. Although there is some long-distance packet on shortwave, virtually all of it is on 2m and up.

>I realize I sound frantic, but I don't really know any hams personally;
>The only guy who has any idea is a friend of mine who is unlicensed, has
>only a scanner, and continually refers to propagation as "propaganda".

Eeek, you *do* have a problem. :-) Either call the group from whom you intend to take your ham exam, or a local electronics store, and find out where the nearest ham club is. Good luck!

When I buy a radio, or a TV, I *ALSO* buy the service manual. If I expect to keep the device for a while, I look through it and its schematic to see if I can guess what parts might fail and what parts I might have trouble getting. Then I find out what the hard-to-get parts might cost, and on occasion, buy one for a spare.

It's self-insurance. If you buy a radio that YOU can't fix and YOU can't guarantee availability of parts beyond the manufacturer's normal design service life of the equipment, WHOSE FAULT IS IT?

Hmm.. funny I go to an engineering school and EVERYONE with a 28S
(including me) has that infernal battery door broken off! I guess most
of us havent tried to get new ones, but they only last 6 months anyway.
Don't praise poor design and engineering and that battery door is a prime
example of it. I guess your door didn't open up in your briefcase and spill
the N-cells everywhere for an hour, wiping out months of data in the
machine either. So, now everyone duct-tapes or electrical tapes the
door to the calculator.

otherwise the 28s is one of my most prized possessions, though.

Also..one of my friends needed one fixed and in true modern day form
bought a new one when he found out how much it'd cost to fix the old
one. (I guess the case is practically unopenable!

>MHz set, but all it gives are "magic" numbers. No dimensions in terms
>of wavelength. Is both radius AND length a factor?

It's basically a 1/4-wave coaxial cavity resonator. The length is actually slightly less than 1/4 wave so it can be tuned to frequency with a small variable capacitor. The diameter has little or no effect on the resonant length. Assuming you do everything else right, bigger diameter gives you higher unloaded Q (which translates to lower insertion loss, narrower bandwidth, or both).

One thing to watch out for is frequency drift vs temperature. If you are using a notch-type duplexer (the usual kind), the "nose" of the notch is very narrow, so drift can be a major problem. If you plan to use the device in an indoor constant-temperature environment, no problem. But if it is to be used in an unheated vault, watch out. The good commercial duplexers have various schemes to temperature compensate the resonator.

It can be difficult to obtain the theoretical loss (Q) value. All high-current connections (such as the bottom of the center conductor) should be soldered with silver solder, or better yet brazed or welded. Smooth out any rough edges/surfaces. USE NO STEEL or other magnetic materials inside the cavity (VERY lossy at RF).

Good luck.

THE MODERN HAM RIG

As someone who services ham equipment for a sideline, I}purchase many service manuals on new equipment. Several months
ago I bought the manuals for the Kenwood TS-850 and the TS-950.
After carefull examination I determined that there was a radio in
there someplace if you looked hard enough. There (to quote WA2DYA)
was enough computing power in each of these rigs to run a small country .
In the 950 on the display board there are about 137 individual transistor to drive
the various elements of the display. I have a spectrum analyser to
evaluate the RF performance but I would need a logic anaylser
and more info the is in the service manual to de-bug the digital
sections of these rigs. I work with military commucications
equipment most of that time and that stuff is simpler in design
the the new ham gear from Japan.
For my own liking I prefer a nice large tuning knob that tunes
a receiver that won't crunch out on me. Spend the money where
it counts...on a front end with a high level double balanced mixer
that gives at leat +30 dbm third order intercept...followed by
a high dynamic range IF amp and filters that don't ring. You
can take your 100 memories and other bells and whistles , give
be a great receiver and a good performing transmitter..
The Ten-Tec Omni V on the other hand had one micro on a small
board controlling the the frequency control circuits. It is
over 90 percent radio. I will buy the service manual for the
Omni VI as soon as its available. Ten-Tec's strong points include
service and design...now if they would only shield their modules
better.....

What are your opinions?? more bells or better radio performance

Source record: 290800

If anyone wants the full design info, go to your local library and ask them to get a copy of US Patent 4,733,243. My local public library in Rockaway NJ (yes, there is such a place) obtained it in about a week and at no charge at that. It seems that the State library system in NJ has CD rom access to these documents. It's about six pages long. Also, the terminating resistor in the patent document is *600* ohms. A counterpoise and not earth ground is recommended. The max. directivety is towards the 10 meter (nominal 40') high mast. The Inside angles are 60 degrees . The short mast at the feed point is nominally 1 meter high. The feed impedance is about 600 ohms (unbal).

The values for the wire lengths can be worked out using the law of sines and/or Cosines as needed. The right triangle formed by the overall antenna from the 1 meter mast to the 10 meter mast is 1,2 sq.root3 (i.e. the inside angle at the short mast is 30 degrees.)

The design seems to meet the need for a simple directive wire antenna with mininimal components. In the version described in the RF Design article, it is reasonably flat from 6 to 30 Mhz.

RE: LARC.

The point here I think is they really should have a right to advertise if its in good taste. I am heterosexual and really do not feel threatened by a short ad (like those in 73) that identify the club, its purpose, and how to join. If I ran a magazine I'd allow it.

The LARC has a right to be pissed and I think they have a case, also. The advertising policy of the ARRL I believe (if I remember right) is only to disallow illegimate organizations to advertise, and I do not see the LARC as illegimate or trying to ripoff anyone.

And yes, the KKK amateur club has a right to exist and advertise too.

What ever happened to the first amendment? I hope the ARRL loses. I'm dissapointed in you homophobes, our constitution should be stronger than your personal distaste for gays.

>AL N1AL

Al, this tale dates you (within a few decades, at least).

Let's make sure that we point out to the solid-state crew that a
5U4GB is a vacuum-state rectifier from the 50s-60s era. (It glows in
the dark!)

This one is in the same class as RG8U.

For some reason I feel compelled to add to the discussion about the servicability of new radios.

In article <1992Apr21.153811.16674@gvl.unisys.com> rossi@gvlf8-m.gvl.unisys.com (Pete Rossi) writes:

I am still using old tube (that awful word:-) radios. For what I am using my radios for, they suit my needs just fine. I am not on the air enough to justify spending $$$$ for a new modern radio... So, as long as I can keep my old trusty Heathkits running, I plan to keep using them (forever?).

Congratulations Pete.

<stuff about whether to advise cousin to buy old or new rig deleted>

I realize that I'll be comparing apples to oranges, but please bear with me.....

A long long time ago I worked in the electronic consumer entertainment maintenance industry (a TV repair shop). It wasn't a stellar living, but there was enough work to keep several employees busy at several shops in our little city. The failure rates were pretty high in those days. Then along came transistorized consumer electronics and the business just dried up. Without the limited lifetime of the tubes and the high temperatures, the things just kept on running.

The oldest pieces of transistorized equipment that I own are more than twenty years old. The only service they've had is mechanical service and they both work just fine, thank you. This in spite of being dropped, splashed and operated on top of an induction heater.

I would guess that if your cousin operates as (in)frequently as you do and if he protects his rig from obvious harm that he should be able to get at least 20 years of service from a contemporary solid state radio with little or no service required.

On the other hand, if he's really enthusiastic about amateur radio and works the thing every chance he gets then he'll want to upgrade to a more versatile (sp?) radio and the issue of life span is irrelevant. (But the issue of resale value becomes more important...)

Just my two cents worth.

Again, congratulations on your ability to keep the old Heathkit running. Perhaps it will fall to the next generation to keep the old Icoms running. :-)

1283. Re: Seeking Information on VOX Headphones for ICOM IC-24AT

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-21 22:00:45 UTC
From: vail@tegra.COM
Message-ID: <3256@atlas.tegra.COM>
Source record: 290807

In article <18APR199220584826@mars.lerc.nasa.gov> tidedu@mars.lerc.nasa.gov (William T. Dedula) writes:

I am planning on purchasing a pair of quality VOX headphnes/Mic for use withmy ICOM IC-24AT. I will use them primarily for talking on 2-meters while on the bus (Public Transportation) and while riding my bike.

I have looked at a photo of the ones ICOM offers for the 24-AT and they seen to be built cheaply (Though I have never seen them in person). I'd like to know if anyone has the ones ICOM sells for the 24-AT and can tell me how good they like them ?

I'd also like to know if there are other sources where I can go to get these (Other than ICOM) at a cheaper price -OR- of better quality ???

ANd finally (But nevertheless very important), I'd like to know how a pair of VOX headphones works ??? Can anyone speculate (or does anyone have personal experiences) with using them in the same way I want to (On a bus, or a bike) ??? Are they effective in one or both of these settings ???

When bicycling I prefer a speaker/mic.

For motorcycle use I got the Icom VOX unit and using old headphone elements and a electret microphone I added a compatible plug to my helmets. Mic audio was reported excellent but ambient audio noise made listening to it impossible at highway speeds. As for the VOX, I found that that I was never happy with the settings. It was always too sensitive or not enough. I also added a switch to the VOX unit to disable it.

When I upgraded to the W2 I got into a quandry about my helmet audio standards. Since the W2A is not compatible with the older series of VOXs and speaker mics I needed something new. The W2 VOX unit comes complete with earpieces and boom microphone. Not exactly what I wanted.

I ended up making a small switch box with external PTT cable that I tie wrap to the handlebar. This I find to be much more acceptable than the VOX unit.

This also solved some other problems with the W2. On the 24 and previous radios the VOX derives its power from the "ring" of the mic side of the plug. On the W2, two outputs have some quirks. The first jack has a speaker output and the mic input. The second jack has

another audio output and the DC power out.

Not too hard, but, when you connect to the first plug you get both VHF and UHF on the audio output. If you connect only to the second plug you get UHF on the plug and VHF on the W2 speaker. When you connect to both plugs you get VHF on one and UHF on the second. Since I didn't wire my helmets for stereo and wasn't keen on different things in different ears anyway I could really just wire an adaptor to the VOX.

So, the moral of the story was that after using VOX for a couple of years I switched to an external PTT and was much happier.

BTW, if there is enough interest I can post a detailed description and schematic of my switch box and helmet modifications. About $15 at radio shack including headphones, connectors wires and box.

Source record: 290808

Folks, this rathole seems to be getting rather deep.

SET SOAPBOX=ON

Car manufacturers are REQUIRED (last time that I checked) to keep safety related parts in stock for 10 years. The glove-box lock is not, IMO, safety related. Yes, JC Whitney probably has it, but they make there business of stocking replacement parts that others don't/won't/can't stock, and the quality of some of the parts is suspect (NOT all parts).

I'm biased, I have an ICOM U-16 for commercial use. So do a number of my friends. ICOM has repaired them without either trouble, or excessive charge.

As most in the computer business know, a machine is obsolete after 5 years. Somewhere you may find someone to support that system, for a price. They've probably stockpiled the parts (I know someone that stocks IBM PGA and RT boards, and sells them for a good price, to people who REALLY NEED THEM).

The microprocessor controlled radio may have a fine rf section after 10 years, but the computer in it is very obsolete. Finding parts for is will be a pain, if not impossible. People are griping about finding parts for an HT which may have cost $1000 and will have sold 10000 units. Try finding parts from a manufacturer for a 10 year old PC that sold 100000 units. They won't have them. You may find them elsewhere, but don't count on it.

In short, if you want a guarenteed source of the specialised silicon, buy two units and only use one. Other than that, you may have to go back to simpler equipment, with fewer "funny" part.

SET SOAPBOX=OFF

I don't expect everyone to agree with me, your choice.

I used this method to pass all my CW tests. Just copy what you can and put a underline where there is a character that you missed. If you miss or don't understand the character that was sent LET IT GO BY! IF YOU SPEND ANY TIME TRYING TO FIGURE OUT WHAT IT WAS YOU WILL FAIL THE TEST!!! Because 5 characters will go by before figure out what it was. Just keep at it and you'll get it. I used the exact same methods to get my Extra so they do work! Good luck!

> ----------

The "insensitive front end" symptom of the FT757 is not caused
by a poor front end design, rather it is caused by insufficient
IF gain. I added an extra stage of IF gain right before the
second IF filter using a BF980 MOSFET set up for about 20 dB.
of gain. I built it on a postage stamp size board and glued it
to the side of a filter can that happened to be in the right
place. This completely fixed the sensitivity problem, even on
10 meters (I can tell if the band is open or closed by the noise
level as indicated on the S meter). Also, the AGC works much
better on weak signals.

I also added an RF choke to the +12 volt line to prevent RFI
caused by RF flowing on the DC lines to the power supply. There
is a convenient cavity in the housing right next to the connector.
I highly recommend this if you have TVI problems.

From: cvm@nauvax.ucc.nau.edu
Message-ID: <21APR92.22442148@nauvax.ucc.nau.edu>
Source record: 290811

Could someone please explain to me exactly what the antenna and feedline impedance means? I don't understand why different types of coax have or need different impedances. Also, can someone tell me what the impedance of RG-59 and RG-62 coax is? I have some extra lying around and want to know if it is suitable for an amateur radio antenna feed line.

Is this info is probably in the ARRL antenna handbook? I haven't been able to pick up a copy yet.

Speaking only for myself Jon, I think that this has nothing at all to do with Amateur Radio and would really prefer that you, and the others involved with the LARC stop the parade. I don't give hoot what your sexual orientation is, how your life was fraught with fears, or why you decided to come out...it's just not QSO material, ok?

The ARRL is perfectly entitled to refuse advertising from anyone, for any reason and there is nothing you or the LARC can do to change the situation!

BTW; don't forget about the rights of others; namely that some people would just as soon never hear from you or LARC about anything..not even this little mess. So don't go away mad, just go away....please. And take this non-issue with you!

RG59 is 75 ohm impedance, RG62 is 93 ohm. The RG59 is what cable TV
and TV antennas use. If you have lots of RG62 laying around, you
might be able to use a pair of cables connected in parallel (use exactly
the same length) to feed your amateur antenna. Two 93 ohm's in parallel
gets you 46.5 ohm, close enough to 50 ohm for hams :-)

```

Well, since you are so close to this new unit, and I am
seriously considering buying one..... :-) I have two questions.

1. The PK-232 is much easier to use when using the PC-PAKRATT
software that AEA has available. Is anything like that planned for
"normal" use of the 2232 (not the more "exotic" modes).

2. Is there any provision (yet) for the user to add modes, knowing
the protocol, without having to do the detail programming of the
DSP chip. That is, do they now provide macros (or whatever) for
setting the filters, timing, etc?

Thanks!

I don't understand. Are you claiming that there are no hams who read QST who might be interested in joining LARC?

BTW, has anybody actually seen any evidence that LARC is actually suing? The most I've seen is a suggestion that LARC may have filed a complaint with some Connecticut state anti-discrimination body.

Well - they are BREAKING the RULES. This lawsuit is SHEER HARASSMENT ! They aren't keeping to themselves, and they are affecting our lives. They are going out of their way to pester us. That "We're here and We're Queer...." line made my blood boil. The way they are going it's going to be "We're Queer and We're Outta Here".

Ahem. The "We're Here and We're Queer" line was not from the LARC ad, it was from a post here on the newsgroup (from someone who wasn't even a member of LARC, as I recall.) You can see the LARC ad in 73 Magazine, it's an exciting 1/2" of column space that says something on the order of

LARC, a club for gay and lesbian hams; Join us. We have a newsletter and a net, write us at ...

If this is your idea of "going out of their way to pester you" you're far too sensitive to be reading USENET.

[And yes, if the Klan Amateur Radio Klub wanted to run and pay for an ad saying

KARK, a klub for paranoid racist white men; Join us, we have a newsletter and a net, write us at ... Enclose picture or other proof of racial purity and sex.

I think the ARRL should take their money and run the ad.]

Well, the Omni VI is supposed to have a lot more bells and whistles than the Omni V. TenTec said to me, "Look, we had a microprocessor there and we had to give it some things to do, so we threw in ..." But I do hope the VI is at least 75% radio. I've had one on order for a month -- TenTec is quoting delivery now at around May 15-20.

>(narrow shift), and HF-WEFAX charts.

I beg to differ with respect to the job it does on HF-WEFAX charts. It does not do gray scale, so the cloud images are not too good. Worse, it throws out something like 2/3 of the data to fit the image on an 8.5 by 11 sheet. I managed to write a program to get this down to 1/2 the data thrown out and print onto 9 (!) sheets of paper. You can't do any better since the PK232 won't accept the parameters. The large images are much better than what the beast will print directly, but still do not utilize the full transmitted detail. On the other hand, even the small images are as good as a cheap thermal HF fax I have seen offered for sale.

This is YOUR opinion, one you are entitled to but one which is nonsensical at any rate. The LARC advertises regularly in 73 and as a result of this advertising I joined, as did others I know.

YOU sir, do NOT speak for everyone. It was not possible in your generation nor in any other. You may have THOUGHT you and your peers had a lock on expression of thought, but you're quite mistaken.

You're a dinosaur, and I'm glad to see your type sinking in the ooze of history we'll place you right up there with the other bigots and insensitive arses that have littered our social conciousness...

>It's going to cost foolishly spent money and tie up the court system.

>
>Anyway - I think that CBers are our enemies in many ways and that we should be
>supporting every move leading to destruction of CB.
>

Hm... Couldn't find any rational arguments against CB here...
I fully agree about pirates but why do you want to destruct CB
and not the pirates ?

I agree that CB band in Poland is getting more and more crowded
but would say it's not the CBer's fault. Here in Krakow CB channel
occupancy is close to 100 % but people are still polite.
I must say I'm nicely suprised about it.
However from what I know (but these are unconfirmed data)
it is not that nice in Warsaw...

Some background for foreign readers: Last exam for amateur license
in Poland was in March last year. The problem is not that there are
no voluntier - there is no commity to give an exam. Due to introduction
of new roules it needs to be formed and the date is still unknown.
Thus lot of young people truely interested in radio go for CB.
This effect adds extra load on CB band.

Question:

I know that manufacturers of other types of equipment (camera equipment comes to mind) have USA based versions of the company in the USA. For instance, Canon has U.S. Canon (or something like that). Basically, the U.S. based company provides another level of quality assurance and handles things like warranties. It also costs more! One of those things like insurance: You don't need it until you need it.

Is this type of arrangement also true for companies like Yaesu? In other words, could it be the case that someone in the U.S. is dealing with considerably different folks than say someone from Findland?

1304. How many people would want a summer update to callsign project?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-22 15:59:57 UTC
From: rusty@anasaz
Message-ID: <1992Apr22.155957.9849@anasaz>
Source record: 290827

Well, I have the opportunity to get a summer update to the
FCC master database. If Andy or I split the cost with the
person wishing to purchase it, then we can do another callsign
project "release". My understanding of the mail Andy and I
have exchanged is that he does not want to do one this summer.

SO: how many people would be interested in "yet another round"
of the callsign project? (for the un-initiated: the "callsign
project" is a term that I came up with (or I think it was my
fault :-) to label what I was doing. Which was: a group of us
got together and bought the FCC amateur master database, I
converted it into something useful and made copies for everybody.
That was the first year (more or less), and following years have
been similar (more or less - you REALLY don't want a full description
of each year, what we did, etc - trust me :-) (besides, I don't
want to have to type it in - talk about waste of bandwidth! :-))

Regardless of whether or not we do Yet Another Callsign Project,
the tape has been ordered. It is supposed to be current as of
May 1 or later.

At the moment, it does not look like I have the time needed
to commit to the project. I will be talking to a person I know
(who is NOT well-connected to the internet - nay, I think he
is not at all connected) to see if he wants to do it for the
summer update. He already told me that he could not let it
take TOO much of his time, so it would help me to know about
how many folks are interested in a summer update - so how
about it? How many people would go for a summer update?
(probably pretty much like the previous ones - $20 (or was
it $25, I forget!) plus media and shipping (and in the past
I've strongly encouraged folks to send in their own media :-)).

I've supported 9-track 6250 or 1600 bpi tar or cpio or "pure data"
and DC600 or DC300 carts tar/cpio/pure_data formats (any of the above
with or without compression) in the past (I even did ms-duck disks
for a couple of years - ack! and one year I even did mac disks - never
again! :-). I even did ebcdic. However, I think that the person I
know is mainly a 9-track ascii person, we would have to find someone
else to do ebcdic 9-track (I think anyway) and the cartridges.
Any volunteers? :-)

There is also the VERY small chance that I'll do it myself, but don't
hold your breath, it makes your face turn blue, and accomplishes no
useful function.

Anyway, to make a long post slightly longer (and to repeat myself -
I suppose mainly to get the main question down at the bottom of
the post): how many people would want a summer update? and what
media and format? Thanks!

And Finally: best bet is to use our "new improved" address -
an internet address:

Question:

Do companies like Yaesu have an American based version as do companies like
Canon (camera) has in U.S.A. Canon? I know that when I bought my camera there
was two different prices for the "same" camera. The difference was that in
buying it from U.S.A. Canon, there was more of a quality assurance check and
also they handled any warranty claims so that the camera didn't have to get
shipped back to Japan. Maybe someone in Findland and someone in the U.S.
would be dealing with different companies (although obviously related)

>be a great receiver and a good performing transmitter..

> What are your opinions?? more bells or better radio performance

Well, both actually....

I've seen a lot of talk on this forum lately regarding how nice
it was 20 years ago to build your own rig and how it has lasted
all of these years. This has been contrasted by the newer rigs
which on the surface seem unrepairable at best and disposable
commodities at least. Is this a fair assesment of the current
state of amateur radio electronics?

20 years ago, nobody would have forseen the impact that the
ubiquitous 2 dollar computer chip would have on our lives.
Today, virtually no consumer electronics gadget is without one,
from cordless phones to television sets, from microwave ovens to
washing machines. Why then, should amateur gear be exempt from
the mainstream of modern electronics?

The primary reason that microprocessors are used in all of these
appliances is not their "gadget factor", its their cost. There
is no economical way that appliances can be built today without
them. When a $2 chip can replace a whole footlocker full of
gears, pulleys, relays and switches, and their associated labor
intensive assembly costs, its easy to see that there is no
alternative.

It has already reached the point at which fully functional and
self contained MPU's with internal RAM, ROM and D/A and IO can
be thrown at almost any engineering problem. In some cases, the
applications to which these single chip CPU's are tasked grossly
underutilize the available processing power. Could you imagine
using a single chip CPU in place of a 555 timer IC? Yes? No?
Well, fear not because it _is_ going to happen...

Like it or not, we're living in the disposable consumer products age. (Perhaps BiC or Pentel will someday build a ham rig? :-)

Here's what we have today: Costs are extremely low in real dollars, MTBF's are extremely high, and device integration is steadily increasing. The old Heathkit SB-300/400 series might get basically the same job done (communicate) but ultimately it costs more and is less reliable than anything built today. But to be fair, 20 years from now even Icom's IC-781 or Yaesu's FT-1000 will be junk box boat anchors as well. Yes, some of them will probably still work, and some will still be in "mint" condition but, so what??? By then there will be radios which will essentially have only one chip inside of them... Everything which handles audio, video and RF will be digital and will be based on some form of DSP. But by then, the old timers will yearn for the days of those "excellent" dual cascaded crystal filters of yesteryear, and the "good old radios of the 90's" which actually had replacable parts in them...

1308. New Kenwood HT 78A

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-22 16:48:01 UTC
From: svec@rtsg.mot.com
Message-ID: <1992Apr22.164801.8919@rtsg.mot.com>
Source record: 290681

Just saw on page 3 of latest QST that Kenwood has a new set of
5 radios... has anyone bought one of the 78As yet? What features
does it have, particularly in the area of expanded receive...
e.g. a number of dual band HTs now adays cover (+/- a few megahertz):
118-136 AM 136-174 FM 420-500 FM 800-950 FM
I wonder if the 78A can do all thhat (I believe the 77A had a few
holes in the receive around 460 and again around 850 or so while
the Icom W2A more or less did all of the above and the new ALinco
does much of the above with a few holes in the coverage).

Would be nice if they picked up 222-225 RX.
The bottom line, is I am looking for a dual-bander / scanner-replacement.

Appreciate anything on this new radio (by the way, they said see it
at Dayton... unfortunately I am not going to Dayton).

I love how the people doing all the screeching, name-calling, & ad hominem remarks are the ones... 'like Jon.'

I simply say that I think homosexuality is gross & support the *possible* ARRL position of not wanting their ads, & the gays jump out of the closet screeching about how evil & oppressive I must be.

The tantrums by Jon et al. certainly haven't done anything to change my opinion of gays.

Sorry if this is a duplicate posting, I have doubts that my
first one went out!

I am seriously looking at the new Alinco DJ580T Dual-band HT,
but would like any comments from owners of this radio.
Particularly how well it handles intermod and such. Really
just any comments about it would help out.
I don't have the good fortune of having a ham store nearby, and
it's tough to make a choice based on pictures alone.

Thanks! I will post replies to the net if I get any!

1311. PK-232 WEFAX data modes

Source record: 290685

Hello,

About a week ago there was a short thread on PK-232 WEFAX data formats. (I was on vacation and just now have gotten to all the mail.) It seems that the questions were not resolved. I have experimented some with the serial WEFAX ouput on the PK-232 and will pass along my findings.

The data from the PK-232 WEFAX comes out as printer control escape codes. The exact format is dependent on what PRTYPE you have selected. I am only familiar with the codes for the NEC-8023a (Apple Imagewriter I). You will have to consult your printer manual for the exact format for your graphics codes.

The format on MY printer is as follows:

<esc>S####xxxxxxx...

Where the #### tells the printer how many bytes of graphics data will follow. The xxxx is the graphics data. Your printer will probably use different codes and formats. (The PRTYPE I usually use is 17.) The bytes print out as columns of 8 dots with the MSB up. The usual density is 960 dots across the page.

The only problem is that the PK-232 seems to randomly add or subtract bytes in the data section. I talked to AEA about this problem and they told me it was probably a problem with my serial port. This may be, but I run AmigaNOS and regular packet without any problems. Conversely, the data prints out flawlessly on the parallel port. I still have some troubleshooting to do :(.

If anyone has had experience using the WEFAX data off of the serial port, I would appreciate hearing about it.

I'm trying to decide for vhf/uhf mobile antenna. I looked for the Diamond NR-770SA and the Comet B-10. I would appreciate any suggestions for these two or for anything else. Please contact by e-mail.

Tantruns? Son, go back and read the reactive followups from the
dinosaur camp. The anti-human-rights sentiment that's been going on
here sure has changed my mind about hams. I forgot what a bunch of
fossilized idiots are in my hobby. It's amazing how regressive people
in a technical hobby can be.

Perhaps you should be working on a radio that will let you communicate
with the repressive "Father Knows Best" fantasyland universe; because
you're not going to have too many people to talk to in the future.

Whether you think homosexuality is gross is your own opinion. When
you start discriminating against people who do things you consider
gross, it becomes everyone's business. I think, sir, that you are a
fool, but I will not stop you for advertising for the "Fool's Radio
Club" in QST, should you wish to do so.

Paul, let's be careful here... While your response to Mr. Tyler seems accurate and deserved, remember that there are a _small_ number of people reacting from the dimly lit end of things. While I wish that there was more of a dialogue on the subject so that we could learn a lot more from our fellow HAMs, I'd be cautious to brand all the Amateur Radio Operators here with the same brush.

I'm certain you didn't intend to do so, but I just wanted to ensure that those who have been silent on the issue are not compared to those who took the time to pull their heads out of their respective orifices and stink up the air :)

RG-59 is 75 Ohm, normally used for TV/Video stuff. RG-62 is 90 some odd ohms (92?) and is generally used to hook up IBM dinosaur computer terinals.

Since most ham rigs want to see 50 ohm line, it's not clear how useful it will be to you, but if you WANTED to you could do something to match the impedance. On the other end many ham antenna's impedence is really 50 Ohm's anyway. For example RG-62 is a better match to most 1/4 veritcals than RG-58 is anyhow.

I'm trying to work with some 75 Ohm stuff now because I suspect that the ham community could live for quite some time on the scraps from the local cable TV company.

Check the diodes. First, when using a Dummy Load, your Vf=10 and
Vr=0. If you have a bad or leaky Rev diode it really won't show up. (In fact,
you don't need a rev diode if your load is perfect! 8-)) A 50 Ohm DL
isn't always a good test. If you can, put two 50 Ohm loads in parallel.
The SWR ought to be 2/1. That's a better test.
Swap the diodes. Does the problem still happen???

>can take your 100 memories and other bells and whistles , give
>be a great receiver and a good performing transmitter..

Right on! Unfortunately, most hams seem to prefer bells and whistles
over performance -- "Features" are what sell radios these days.
My old Drake TR-7 includes no microprocessor, and has RF performance
better than most of the radios for sale today. But if you want
100 memories, "dual VFOs" (that are really one VFO), keyboard
frequency entry, etc, then you need to buy a Icom/Yaesu/Kenwood
"all chrome and blinking lights" jukebox.

It's hysterical to realize that, in terms of phase noise, receiver
dynamic range, transmitter IMD, audio quality, and maybe even frequency
stability, an old Collins S-line designed 30 years ago (vacuum-state
technology!) is better than most of the radios built today.

1322. FTP host_ids

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-22 20:22:08 UTC
From: mdc@vixen.uucp
Message-ID: <1992Apr22.202208.4841@porthos.cc.bellcore.com>
Source record: 290696
Cross-posted to: comp.windows.misc,rec.radio.amateur.misc

A couple of years ago some kind soul posted a list of the
host_id numbers for just about every FTP site in the world.
During a move this information got lost.

The current employer's FTP program knows from nothing about
hosts by name only be number. I have wuarchive, bmgt.umd.edu
and now, the new cica, and maybe that is all I need.

What I am looking for is a list of the host_id numbers for those
hosts that have a lot of windows goodies, ham radio and "gif" files,
specially astronomy, earth from shuttle, etc.

Please send via e-mail since there is no need to tie up band-width
on the net because I can't pack things properly.

Thanks a lot a head a time.

Good response! Any significant interference in the amateur bands should be
met with RDF. There really is no other defense than to find the source.

>Anyway - I think that CBers are our enemies in many ways and that we should be
>supporting every move leading to destruction of CB.

Whoa! Maybe that's going just a little too far. Not all CB'ers are evil.
[As flame retardant - yes, some are evil or worse.] I can tell you that there
are many people who get a CB in hopes of reliable communications. They find
varying degrees of disappointment or success in that goal. (It's really only
useful if you have friends with CBs nearby.) As they use it, the exposure to
radios makes many interested in it. CB is a ripe recruiting ground for new
hams. And I mean disciplined and courteous ones, too!

>--
> 73 de Andy SP5WCA

73 and best of luck. We want to see you succeed in your efforts to control
interference on the amateur bands in your area.

Depends on two things. How long it takes you to answer 55 questions
and how organized the testers are for the number of people who show up
for the test. If you start at 9, lunch would be a safe bet. You
could be out by ten if you don't have to wait for things to get graded
too long.

Source record: 290700

> The only problem is that the PK-232 seems to randomly add or subtract
> bytes in the data section.

I'm not sure about randomly, but the MAJOR problem with the 232 fax
mode is that it throws away entire scanlines in order to make the
aspect ratio right for the printer. There's no way around this.
The other problem is no gray scale.

Too bad I blew bucks on PKFAX (software) before I found out this
stupidity. Essentially, as the ROM's stand FAX is useless on the
PK-232, PK-FAX is a waste of money because:
1. The PK-232 can't make any better resolution data than
the stupid printer mode stuff that you get with the
straight cable.
2. The program is hideous to boot.

Thanks to EVERYONE who replied so quickly and were so helpful.

To summarize, it seems that the actual test time will vary from about 45min to
2-3 hours, depending on how organized, how many people, etc.

Doesn't sound too bad to me :-)

Thanks again - you folks are very helpful!

>"throwaway" concept).
>
Gag! $500/year for radios? Ack! I spent about $600 on my 2m/440 mobile rig (Alinco 570), and about $700 on my HF rig (Icom 735), and $400 on antennas/rotators/towers/etc (I now have 2 tribanders, one "pushup" mast, one tower, and 3 rotators (2 of which work)). I expect the current setup to last me much more than 5 years anyway. So that would be $1700/5 per year or $340 per year assuming that

(1) I keep all the extra stuff I bought (not likely!) and
(2) I trash the radios when I "upgrade" (not planned!).

More realistically, I expect the HF rig to last me a LONG time (10+ years) and the Alinco to last 10+, but to be replaced (as the main rig) by some sort of multi-band multi-mode job sometime in the next 10 years.

My yearly expenditure on radios will most likely be more like $100/year. So, a $5000 rig must last at least 50 years before dying a non-recoverable death. :-)

I too cannot buy the radio or the throwaway concept. No timexes (tm) for me (if I can help it - and I may have already blown it by getting the Icom 735 :-!).

Just more blather from the keyboard of:

>
>Steve, let's take a poll. Outside of antique collectors, how many of
>us make everyday use of radios, or cars, that are over ten years old?

Up until last month when we realized that the small Datsun we used
as the family car no longer held a family and replaced it with
a 7-passenger vehicle I drove a 1973 VolksWagen to and from work
every day.

I switched to the Datsun because its gas mileage is much better
and because it has an air conditioner. Considering the ignition
noise, I may decide to switch back to the VW and sell the Datsun!
(rather than selling the VW as currently planned)

Lets see, 1992 - 1973 = 19 years! Wow, that even surprises ME.

My "new" Datsun is a 19

>Yeah, there are tube forever guys out there, but I suspect the majority
>of active hams have bought a radio in the last two years and plan to buy
>another in the next two years.

My first HF radio was an SB102, which I had for 4 years. As mentioned,
current rig is IC735, which I plan to keep "forever". I'm thinking
I may get a VHF/UHF "all-mode" sometime in the next 5 years, or I
may build some transverters for use on satellite or whatever...
But these will be additional radios, not replacements for current
rigs. I may make "a lot of money", but I don't spend a lot on
toys usually. (Don't even have a "decent" HT right now - I have
a Kenwood TR2400 which is not being used because I have nothing
but dead battery packs, but which I got about 5 years ago for $100
and which I plan to keep more-or-less indefinately (I've considered
loaning it to my niece if she gets her license))

So, perhaps I'm not average, but I'm a member of the group over
which the average is to be taken :-)

Actually, I've dealt with Doug (amazing how many folks you meet when doing a callsign project :-), and was a little surprised at reading the posting. while I've not had a LOT of interaction with him, I'd just put it down to having a bad day or indigestion or something, he's seemed like a pretty reasonable person to me in the past...

Just a few more blatherings from:

In article <8JLLRVD@ais.org> tim@ais.org (Tim Tyler) writes:
> I simply say that I think homosexuality is gross & support the *possible*
>ARRL position of not wanting their ads, & the gays jump out of the closet
>screeching about how evil & oppressive I must be.

I know better than to get in a flame war on the net, or even to try to change anyone's mind this way. But I'm so grossed out by this posting that I have to at least say something.

I'm not talking about "political correctness" here. Even Tim might be aware enough to think he couldn't get away with saying "I think black skin is gross & support the *possible* ARRL position of not wanting their ads" or "I think Judiasm is gross & support the *possible* ARRL position of not wanting their ads". Or women. Or whatever. It saddens me that saying the same kinds of things about gay people is considered acceptable enough that it's even a matter of controversy.

Tim, I don't expect to change your mind about it, but you should be aware that you are living in a world where about 1 out of 10 of the people you see are gay whether you know it or not. Where your "simple" attitude is in many places considered as unacceptably bigoted as similar attitudes would be towards people's race and religion. If you applied for a job here and I heard about it in time and recognized your name, that posting of yours would be enough for me to take a stand against your getting the job, and probably would be sufficient grounds for you not to get it. Not because it isn't "politically correct". But because we have lots of people working here and lots of people as customers, and we had better not subject them to bigotry against their race, religion, gender, or sexual preference. If we are going to be intolerant about anything, it had better be about something which is hurtful and which people can choose to change, like intolerance itself.

-- sidney markowitz <sidney@borland.com>

I have League insurance, and although the rates are high (1.5% of value per year) I think it's worth it. My car was broken into 3 months ago and a dual-band transceiver, laptop computer and stereo were stolen.

The stereo was gone (it wasn't ham radio gear) but the League-sponsored policy paid full original cost for the dual-bander (which was probably 4-5 years old) and for the laptop. And the laptop coverage was free, since I had purchased it less than a year ago and its value was less than $1000. I faxed the agency a claim and had a check a week or two later.

Given that most auto or homeowners policies won't cover ham gear in a vehicle, this insurance can be nice to have at times.

Phil

1343. ICOM 735

Source record: 290716

OK, so I'm convinced I should buy an ICOM now. :-)

But seriously, folks, I am considering a 735 (used?) for a combination base/mobile rig. Does anyone have any feedback on this radio? I want to use it at home mainly for AMTOR and CW with full QSK. It seems to be a good size for the car.

Are the past QST reviews on-line anywhere?

Thanks and 73.

Fred made some very accurate points about what is happening with consumer gear, but I perceive the original poster as saying, "Now we have great modern radios, with lots of features, but the bottom line figures, show objectively poorer performance." ... I don't know if this is TRUE or not, but it bears examination. Can someone provide quantitative analysis of the top-of-the-line "old" radio versus some newer ones? I'm a 25 year old ham, and I've got a rig that's nearly as old as I am for HF. For the simple reason that it's affordable. Of course, I also drive a 32 year old Mercedes (cheap AND reliable), and collect PDP-11's (heavy AND slow), so I'm clearly insane.

I just recently got my no-code license and haven't been much on
the air. So probably what I'm going to ask is a pretty stupid question
for you guys but I guess I'll just ask anyway...

Well, I live in Missouri (close to St.Louis) and a friend of mine just moved to
Orlando, FL. Since I have no HF privileges I was wondering if anyone could
suggest a good way to contact him there using a frequency that is available
to me. I have access to a 2m repeater here and some other equipment at our
local club. BTW, he has a no-code license as well..

Thanks for your help

One possibility is to use packet. Both of you get TNC's and terminals or
computers and find local packet BBS's to call home. Then send each other
packet e-mail. Of course, this is not a "real-time" method of contact,
and not meet what you had in mind. But it is a pretty reliable method
of exchanging messages.
Hope this helps... WA2ISE@N2DSY

Well, if you want to blow some more money (:-) look into the
AEA-FAX . It consists mainly of an audio to digital converter that
mounts in line on one of the serial ports and the rest is done in
the software. It outputs to the screen, and you can save the files
in PCX format. It does 16 grey scale (VGA) or false color, and is
such a vast improvement over the 232 that it's hard to believe.
The only real problem with is it will cost you another $100.

>cm bands.
>Jim
Wrong. I have the Icom W2A with the extended receive mods and it will except any frequency up to 1300 Mhz. I am not sure how far up it actually receives, but I know it goes up to at least 800 Mhz (public service 800 mhz band it gets!). On the 2 meter side I can also punch in 101.1 Mhz, but I can't hear DC101 (the local FM Broadcast station). I can also punch in 1 Mhz but that doesn't mean I can hear anything there.
-No I don't remember the mode for the extended receive (it is a software mode that involves about 20 fingers).
B.T.W. don't get water in your W2A it makes funny noises untill you get it dried out. (I shook the water out of mine!)

1349. PK-232 RF Ground Loop Modification

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-23 05:06:38 UTC
From: rliles@heimdall.mlb.semi.harris.com
Message-ID: <1992Apr23.050638.4987@mlb.semi.harris.com>
Source record: 290723

The following modification was developed to eliminate a RF ground loop occurring between my Kenwood TS-440 and AEA PK-232 TNC. Whether or not this mod will apply to your application, will depend on equipment type and operational configuration.

In my station, I run all my equipment off the same power supply, to enable UPS capability by means of a lead-acid battery floating across the supply. In using the TS-440 and PK-232, I experienced RF ground looping, whenever I transmitted and left the PK-232 audio cable connected to the ASFK input on the TS-440. While trying several *recommended* mods, this is what I developed, which has worked quite well.

Parts required: 1 - 1N4001 diode (or equilavent 1N4004, etc)

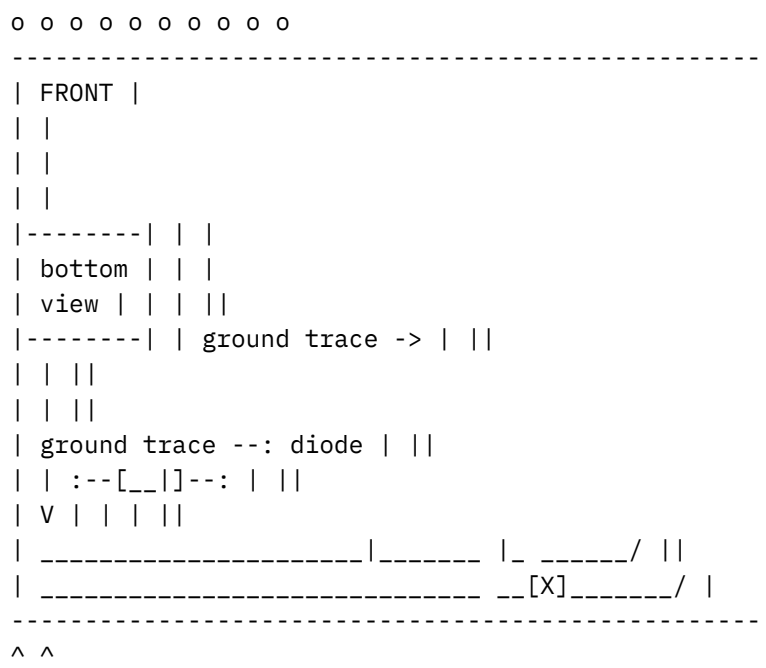
Remove the mother board from the PK-232 housing and turn upside down.

Position the board with the rear side close to you and the front of the board with LEDs facing away.

Cut a 1/8" section of the ground trace near the power connector.

Place the diode with cathode (banded end) at the connector and the anode end on the other side of the cut trace.

NOTE: DO NOT perform this for the entire ground system! Leave the ground trace on the side of the mother board alone.



cut trace section --: :-- power connector

1351. Monthly Solar Review & Six Month Cycle Outlook

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-23 08:19:41 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.704017181@honte>
Source record: 290725
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

-- MONTHLY REVIEW OF SOLAR TERRESTRIAL ACTIVITY --

Summary for March 1992 and Six-Month
Solar Cycle Outlook

Data Provided In-Part by the
Space Environment Services Center, NOAA

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK APRIL 1992 - OCT 1992

We are now in month 67 of solar cycle 22. Activity levels plummeted nearly 92% compared to February levels. There were only four energetic events in March compared to 49 in February. Average daily indices were also down in March, from 25% for the 10.7 cm flux to 58% for the average daily sunspot area.

The four energetic events recorded this month originated from four different regions. The largest flare and only major flare of the month was a long duration M7/3B at 15/0154 UT from Region 7100 (S14, L=136). This flare was accompanied with significant radio bursts across the spectrum as well as strong Type II and IV radio sweeps. The three remaining M-class flares were: an M1/SF at 08/0106 UT from Region 7093 (S24, L=136), also on the 8th was a long duration M4/2N from Region 7091 (S09, L=196) at 1739 UT, and the final M-class flare was an M3/1B at 31/1545 UT from Region 7116 (S09, L=337).

There was one proton enhancement and one minor proton event recorded this month. The enhancement reached 6 pfu at 08/1030 UT and the long duration C6 of 05/2247 UT is a possible source. The proton flux level reached event criteria of 10 pfu at greater than 10 MeV at 16/0840 UT, this time was also event maximum. The event ended at 16/1100 UT. A possible source of this activity was the M7/3B of 15 March.

Geomagnetic activity was also down dramatically from February levels. Activity ranged from quiet to active. There were no storm days and only six days of active conditions at mid-latitudes. March 17th was the most disturbed day with several periods of minor storming following a sudden impulse of 51 nanotesla measured at 0951 UT at Boulder. The M7/3B of 15 March is the suspected source of this activity.

It appears that prediction models completely missed when they suggested a peak of activity in the March-April time frame. Models are still suggesting that June may be another relative peak of activity. But that remains to be seen.

[Additional Notes Appended by STD:]

The prediction models were indicating a peak of activity in the March to April time frame. These same models have been consistently late in predicting these pulses of activity. Given this, it appears as though the peak suggested by the models was again late by about one month. In retrospect, it is fairly clear that an enhanced pulse of activity occurred during February where average daily indices and activity levels rose. If the models are again late in predicting the next relative enhancement in solar activity, the next relative peak may occur in the May to June time frame. An upswing in the formation and development of active regions appears to be taking place during April compared to the last solar rotation during March where region decay and simplification was the dominant factor. Although it is still too early to say for certain, this tends to support the prediction of increased levels of activity during the month of May (centered about late May or early June).

1352. LARC vs the ARRL

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-23 09:00:50 UTC
From: eeiswh@eeiua.ericsson.SE
Message-ID: <9204230859.AA20649@eeiua>
Source record: 290726

I have been following this thread with some interest though I wonder if Info-Hams is the correct forum
for this discussion. Anyway, what happened to Free Speech, Live And Let Live and all that? Don't you
guys have a First Amendment guaranteeing free speech to everyone? Correct me if I'm wrong but this is
supposed to guarantee (1) that the members of LARC are entitled to express their views and (2) that
the likes of Tim Tyler are entitled to say that homosexuality is "gross" (however wrong they may be).
What I imagine it does NOT allow is any individual or group to oppress another individual or group solely
on the grounds of their race/creed/religion/sexual orientation etc. It strikes me that the ARRL is going
to have to come up with a damn good reason for not running LARC's ads otherwise they'll come out a poor
second in any court case. Isn't the ARRL's action against the spirit of democracy and Ham Radio?
It's bad enough that I have to live in a country (Ireland) where homosexuality is illegal, sex
education is non-existent, contraceptives are in restricted supply and the Roman Catholic hierarchy still
tries to exert a stranglehold on our government. Please don't make me suffer the same crap from Info-Hams!
Simon Woodworth.

Message-ID: <1992Apr23.113117.133582@cs.cmu.edu>
Source record: 290731

Last year there were several posts from Kenwood 77A owners reporting
that the memories could be lost if the NiCad were run down all the way.

Did Kenwood ever admit to or fix this problem?

I put off buying a dual bander because of this issue, and if it hasn't
been fixed, will have to switch brands after 15 years of buying KW...

Most all the modern 'made for ham market' radios seem to contain very
little real RADIO! Instead, they are full of speech-synthesizers, memories,
circuits to tell you the star-sign of the person you are in QSO with, and
other extraneous junk. Who needs it? Not me!

Looking at the published performance figures for ham-type radios, and
comparing them with those of top-line professional radios of the mid-fifties
actually shows we have gone *backwards* in performance terms. Dont get
me wrong; i am not one of the 'things were better in the old days' brigade,
though i do have a liking for tube radios.
Instead of using digital processing-power for 'gimmicks', who will be the
first to bring out a properly designed digital receiver? Using a traditional
analog VFO (I will happily give up 100 memories in exchange for phase-noise
so low it can't be measured with normal lab instrumentation) but digitising
the IF signal (lets say $100 for a decent A-D converter strip) and then
performing the filtering, demodulation, error-correction, noise blanking etc
on a digital bit-stream. With modern DSP chipsets, this is neither
difficult nor expensive, and would make it dead easy to implement new
features like different filter-bandwidths, demodulation techniques,
production of AFC signals for doppler correction etc. because its all done
in software. How about *writing* a 300Hz bandpass-filter rather than
buying one and plugging it in? Who will be the first to produce a 'radio
frontend' that sends its digitised signals down a length of coax into a DSP
card that fits inside the shack PC? Just imagine; direct SSTV/RTTY/Fax/
Packet/CW without all the losses you get by feeding the signal through
designed-for-speech demodulators.

But knowing the major manufacturers they would put it all on custom LSI
chips, make you pay through the nose for it, and obsolete it after 2
years :-) :-)

1359. Alinco 580 release in Dayton

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-23 12:06:18 UTC
From: jay@zen.CAc.stratus.COM
Message-ID: <9204231202.AA17991@zen.cac.stratus.com>
Source record: 290733

If you are going to Dayton this year look for the new DJ-580
users cassette. This is a joint project by Gordon West and myself. The
cassette is free to owners of the product.

I have considered putting together a DSQ primer booklet for those interested
in DSQ only. If I receive enough response I will consider the project. Please
send your response to me at:

Jay_Appell@cac.stratus.com or Jay_Appell@cac.zen.stratus.com

If you would like to leave me mail by modem, use the BBS 1 Hopedale Center
at 508-478-6969. This is a new amateur BBS running from 7AM to 7PM EDST. The
board usually runs beyond 9PM daily. Until I can get another server, online
times will vary. We honor modems running 9600 baud/MNP 5.

Discussion groups have been setup for all ham radio vendors. Comments shared on this BBS
will be conveyed to the ham radio company referenced in the forum. This platform will make
companies aware of how the amateur radio community feels about their products. Please
indicate otherwise if you don't want the
comment forwarded.

1362. Re: Kenwood HT77A question

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-23 13:21:59 UTC
From: dxk10@po.CWRU.Edu
Message-ID: <1992Apr23.132159.11624@usenet.ins.cwru.edu>
Source record: 290735

Question had to do with memory loss during NiCd run down in the TH77A, and whether the problem had been fixed:

Seems that was an early-serial-number problem only. My wife and I each have a TH77A and have had no problems, even when the NiCd is accidentally run down completely. Interestingly, the condition of the radio being "on" or "off" is even a CMOS memory state; the rig is on when powered up again when powered down on.

Good radio; do check on the Alinco 580, also (and let me know what you think, several people I know are interested in one of the two).

What IF did you insert the amplifier in? I did a similar trick: inserting
a 20 db transistor amplifier right after the crystal filters in SB 301, and
the result was breath-taking. It was the most sensitive radio (to RF signal, notnoise, I
have ever worked with.
Now my IC 735 has similar problems. It needs some noiseless amp

either right before or right after the 9 Mhz filters. There is very little space inside and I am wondering whether extra strays would not compromise the rx? What is your opinion and have you heard of anybody modifying the 735?

You most likely have the diode in the reverse part of the circut in backward.
With a dummy load there will be no reflected power and therefore no current
induced in that part of the circut so no matter what way the diode was installed
there would be no reading .

gary@ke4zv.uucp (Gary Coffman) sez:
>The parts manufacturers determine how long a custom chip is available, and
>Ten-Tec, or even Icom, doesn't have the market clout to dictate to the IC
>houses.
WHAT? Custom chips are designed by the Manufacturer (Ten-Tec, Icom et al)
not by the parts manufacturer. If you have a mask, and the current foundry
decides not to make it (?), then you go to another foundry. It is TOTALLY
the decision of the Manufacturer how long he wants to keep the design
around, and how willing he is to pay to retool another foundry.

Semi-Custom (ROM Mask for an example) `may' be a problem.

However, for `standard' components (such as toobs, as a sparkling example),
nothing can be done when the part manufacturer disapears, or decides not
to support it.

Nope, I have an ad from ICOM right in front of me and the W2A, which I would like to own (if I had my amateur license), can only receive 2m & 70 cm bands.

Nope again. I have one and it tunes there fine. Its deaf as a doorknob in that range, though. I think the duplexor crosses over around there.

The W2 can recieve from about 100-1000 MHZ although sensitivity and usefulness varies.

I just recently got my no-code license and haven't been much on
the air. So probably what I'm going to ask is a pretty stupid question
for you guys but I guess I'll just ask anyway...

I'm in a good mood today so I will give you a real answer.

Well, I live in Missouri (close to St.Louis) and a friend of mine just moved to
Orlando, FL. Since I have no HF privileges I was wondering if anyone could
suggest a good way to contact him there using a frequency that is available
to me. I have access to a 2m repeater here and some other equipment at our
local club. BTW, he has a no-code license as well..

Your options are to: 1) upgrade your license and get on HF.
2) get satellite equipment.
3) learn to phreak.

1 require some work and some money, 2 needs lots of money, and 3 can
get you in jail. Have fun.

>

One critical diference is that Wayne Green owns his magazine and company.
73 is HIS MAGAZINE, not the Journal of the ARRL, which is membership owned
and operated.

I'm sorry I wasn't around to see when he polled his readers, I'm sure the
controversy would have been quite stimulating and enlightening. I'd also
have liked to have seen the Sonny Irons advertisement, to get an idea of
what you mean.

Note I have changed the followup line to .policy :)

1376. New printing of IRCs???

From: fms@sw.stratus.com
Message-ID: <2430@transfer.stratus.com>
Source record: 290749

Hi all,

I have heard mention of a 1992 printing of IRCs (US) that are supposed to be redeemable for air mail postage. Is this true? And if so, is there somebody out there that would be willing to sell me one so I can take it to my local postoffice and say "see, these things really do exist, they're not just a figment of my imagination"? Not only does the local post office not know about them, apparently the next step up in the chain (their stamp supplier) knows nothing about them either...

A couple of years ago some kind soul posted a list of the
host_id numbers for just about every FTP site in the world.
During a move this information got lost.

The current employer's FTP program knows from nothing about
hosts by name only be number. I have wuarchive, bmgt.umd.edu
and now, the new cica, and maybe that is all I need.

What I am looking for is a list of the host_id numbers for those
hosts that have a lot of windows goodies, ham radio and "gif" files,
specially astronomy, earth from shuttle, etc.

Please send via e-mail since there is no need to tie up band-width
on the net because I can't pack things properly.

Thanks a lot a head a time.

All standard disclaimers should be applied at this point.

I'm a VE, and my experience is that it takes a long time. We start at
8:30am most times, and some folks are still waiting around for results at
noon. These are big sessions, and there's a lot of paperwork that all has
to be done perfectly, or it will bounce at the VEC or the FCC, delaying
your new license (of course, upgrades are instant). My advice is to plan
on spending the whole morning, and bring a good book to read. If things
go well, or it's a small session, you might get out faster, but in
general, first-timers are amazed at how long it all takes. Good luck.

Yep, QSOs on all the WARC bands now count for DXCC purposes. The change 30 meters (allowing credit) was made last year, I think. But there is no award or endorsement that I know of for 30 meter DXCC, i.e. 100 countries on that band alone.

Seems like ARRL should offer 6, 7, 8, and 9 (maybe 10?) Band DXCC endorsements once you get the basic 5BDXCC award.

I think Jeff has got the idea right. I used to operate A92C from Bahrain some time back. This is the club station on the island. I was the only operator from the club, and the club was open just once a week, for a few hours. In the first few hours of operation, I used up the club's entire stock of qsl's, several hundreds.

The club policy was to reply to only direct qsl's with return postage. Qsl's via the buro could not be replied to, we simply could not afford it. Even with operation restricted to one day in a week, we were receiving a couple of thousand cards every month via the buro. I know a lot of people would have been upset at not getting qsl replies via the buro.

On another note: IRC's are next to impossible to exchange in Bahrain, or most of the other countries in that area. Green stamps are fine, and one is enough to cover airmail postage.

If what I have heard is correct, you mayt be a little premature with this
request. I believe that the 580 is to be introduced at Dayton, so you will
probably have to wait a week or so for an answer, and then it will be based
on very limited experience. Of course, based on the experiences which some
of my friends have had with other Alinco gear, you can't go far wrong with
their stuff!

>
I just bought an Austin Metropolitan, the tri-band mobile antenna for 2/220/440
It seems to work fine on 2 and 220, haven't tried 440 yet nor have I checked
swr on any bands. It's covered tightly with black heat shrink, about 19", and
NMO mount.
I was looking at the Austin Suburban, a 4' high base station tri-bander with
no radials. Kinda spendy but nice. I wonder how it would do as a scanner
antenna. I have no idea about the theory of either antenna or the gain. The
HRO catalog lists the mobile one at unity gain, but no figure on the base job.
My mobile only came with installation instructions, no other data.

1386. New IRCs

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-23 19:13:37 UTC
From: bert@unirsvl.RSVL.UNISYS.COM
Message-ID: <9204231355.AA01707@unirsvl.RSVL.UNISYS.COM>
Source record: 290759

After several months of telephone tag with the St. Paul, MN post office, my branch post office now carries the new, air mail, IRCs.
I finally talked someone in the Accountable Papers office to call Washington and within 2 weeks I had my coupons.

While on this route, I learned something that should be quite valuable. At the same time the new IRCs were issued, an agreement was reached among all members of the Universal Postal Union to now accept old IRCs at the new air rate. I don't have any proof of this yet (like a document number or name), but if it's really true, people who have hoards of old IRCs are sitting on a gold mine.

> size for the car.
>

I have owned an IC-735 for a few years now. I have a lot of experience with
this radio. Here are my opinions:

BAD points:

1) Controls are very small and can be hard to operate for those with
large fingers. In fact, some controls (granted, seldom used controls) are
even on the rear panel or are to be accessed by holes in the side or
bottom covers. (for example: compression level is on the rear panel,
front panel back light level adjust is made through a hole in the side
panel). Of course, this same problem exists with any of the other brands
of radios in this size class.

2) Worst laid out control: The Mike Gain and CW SPEED control share the
same slide pot control on the front panel. The CW SPEED is VERY hard
to control as the control seems to have the wrong range. It is VERY
difficult to make small adjustments in speed. It seems that a finger
nail's width of adjustment (1/16th of an inch or so) makes major speed
changes). If you alternate from phone to CW often (as I sometimes do
this is a REAL pain. If you want a good keyer with good control, don't
spend your money on the internal keyer option. If you want the internal
keyer so you don't have to carry around extra pounds of equipment, then
the keyer is adequate. (the Mike Gain control works fine)

GOOD points:

This radio is RUGGED!!! I have used it mobile... NO PROBLEMS. I have used
it in contest situations (as part of a BIG GUN station).... NO PROBLEMS.
I have transmitted into SHORT and OPEN feed lines (OOPS!!!!)... NO PROBLEMS.
I even have transmitted (yes... into a dummy load) a 100 watt carrier for
45 minutes straight.... NO PROBLEMS. I have used it in Field day
operations... NO PROBLEMS.

Basically the transmiter on this radio seems to be bullet proof! I have
yet to have any problems with it.

The receiver seems to be pretty good. It may not be as good as the $2000
IC-765, but it does hold its own. I live just down the street from a few

major contest BIG guns... and can be on the air without much problems when they are transmitting on just about every HF band at full legal power. I have actually compared this radio in an A-B test against an IC-765 on the same antenna at the same time. The 765 seemed a little quieter, but without sophisticated equipment, the average person would be hard pressed to notice any difference. Of course we had all the extra filters and such turned OFF on the 765 to make the comparison as fair as possible.

I have used this radio for CW (full and semi-break in), AMTOR, RTTY (AFSK), Packet, SSB, FM, (even AM). It works GREAT.

I have the 250 hz CW filter installed. This allows me great flexibility for CW operation. With the narrow filter switched out the pass band tuning allows the bandwidth to be narrowed from full width (SSB filter) down to almost the same as a 500 hz filter. If I need additional selectivity, then I can switch in the 250 hz filter.

I also use the IC-735 to drive my 432 transverter for operation on OSCAR-13. This works pretty good. One other thing that could be considered a bad point is that the transverter output (as it is on all current ICOM radios) is VERY low. I had to modify my tranverter (I removed its input attenuator) as it was expecting 100 to 500 mw of power (the ICOM radios ouput significantly less than this from their transverter output).

I also use the computer interface that is included in this radio to help me with my automated logging using my computer. I use the program called AUTOLOG with my PC. Another nice feature.

In short, I don't think that you would be unhappy with this radio. I have been looking at the newer radios, but mostly for their larger size. As yet, I have not been able to part with my IC-735.

This may help ...

During the "Sun and Fun Fly In" in Lakeland Florida, I handled many pieces of traffic for various parts of the 7th call area - Most of these came via RN7 who got them from PAN. There was alot of traffic that was passed around ! When I delivered one myself I learned that this was in fact an EAA event. I checked some of these and noticed that the call W4TJM kept showing up. Perhaps you could get a message to him and request information. The best way for you to do this would be to look him up in the book and send a message via your local NTS access point. If you don't know, just ask some of the local hams who might be into that sort of thing. By the way, NTS is National Traffic System (I think). Anyhow, good luck !

>production of AFC signals for doppler correction etc. because its all done
>in software. ...

It's a good idea, but you'd still need a fairly decent crystal filter in front of the DSP. The problem is dynamic range. A 12-bit A/D typically only has about 70 dB dynamic range, which would severely degrade the dynamic range of the radio. It would be fine if you precede it with a good crystal filter (preferably with a bandwidth matched to the mode in use) and a gain-controlled (AGC) IF amplifier to reduce the range of signal levels. But of course, there goes your cost savings.

Fortunately, the IF signal can be undersampled. In other words, you don't have to sample at twice the IF frequency, but only at twice the maximum IF bandwidth. (This is another reason for the crystal filter--to prevent aliasing.) However, the input sample and hold DOES have to perform at the IF frequency: The sample/hold will probably be the limiting factor in both price and performance.

In sum, I suspect it will be done before long, but it is not a trivial task, and is not a panacea.

Now that software, hardware, and human bugs have all been worked
out there will have to be this PC-DSPRAT for sure. There is a multitude
of settings, new commands, and more. The modems themselves have filters
in them that are optimized for the particular application and you
probably don't want to fool with those but stuff like the DCD threshold,
which on the PK-232 was tweaked with a knob, you will set with a
command since it is a number in the DSP chip. If what you are asking
is whether or not there will be adjustable filters provided and
details of how to use them, the answer is a resounding yes. After
getting any bugs ironed out that crop up in the full software release,
my personal attention will go almost completely to design of the
experimenters package, the software debugger for the DSP chip,
and making source code available to aid you to aid you in rolling your
own stuff should you so desire. There is indeed a provision for adding
new modes. It is called QLOAD. The number of modems (and we are
not done yet) is over sixty. I am almost at the end of a 27C512
but I have a socket for a 27C1024 on the board (and they asked would
I ever envision really needing it ;-). All these numbers mean that
it will be nuts to try and upgrade people everytime a change is made
in only a few of the modems. There will be a section on the AEA bulleting
board that will be set aside for you to downline load uploadable modems,
filters, software development tools, etc.

I hope I have answered your questions.

Bob

Martha, it depends on what you want to do with it. If you only want to
do VHF packet, and nothing else, the AEA PK-88 or the MFJ 1270B or the
Paccomm tnc220 are all about the same box.

I own one of the first copies of 735, built in 1985. At that time it
was much better than the competition (TS-430, FT-757GX). My opinion is
generally positive. The only serious problem that I had so far was instability
in .1-8 MHz. It was caused by a poor trimmer in synthetizer. My comments
are :
1. Very good intermod properties; can work on 40 mtrs with preamp on!
2. Very efficient passband tuning,
3. Good and quiet BK on CW,
4. AF noisy, particularily in narrow CW,
5. Sensitivity could be better on 15-10m. Probably a fault of inadequate
gain in first or second IF, and not of the front end. 735 with preamp
= 745 without the preamp.
6. Receives local weather radio on 21.665, with mike and headphones acting
as antennas, not an annoying deficiency,
7. Notch filter useful on AM only.

Having wrote that, I still think 735 was the best buy in 1985. Perhaps it
has even improved since...

jim@sys6626.bison.mb.ca (Jim Jaworski) writes:

>Nope, I have an ad from ICOM right in front of me and the W2A, which I
>would like to own (if I had my amateur license), can only receive 2m & 70
>cm bands.

To clear up the confusion and wrong information being thrown
around, here are some facts.

After doing the extended receive mod, the Icom W2A will receive
118.00-170.00, 322.00-513.00 and 800.00 to 970.00.

It will receive in the 220 mhz range, but sensitivity is so poor
that I couldn't even get an s-1 reading unless the 220mhz transmitter
was in the same room, so it's not really correct to say that it
will receive it.

Below is a post that I captured off usenet a while back...
I dont know who the original author was, this is all I saved.

I did some checks of the receivers using an IFR 500A signal generator
& the following is what signal level I needed to get 1 "S" point on the W2A's
S meters.
At 70mhz, 1mV (milli-volts)
80mhz 0.5mV
90mhz 0.25mV
100mhz 75uV (micro-volts)
110mhz 1.5uV
From here to 170mhz less than 0.2uV
173mhz 1.5uV
174mhz 75uV
200mhz 75uV
250mhz 0.5mV (whats going on here???)
275mhz 4uV
300mhz 1.5uV
320mhz 5uV (changed to UHF main VFO from here on)
400 - 450mhz less than 0.35uV
460mhz 0.75uV
465 - 510mhz less than 1uV
520 - 690mhz less than 2uV
700 - 999mhz varies from 7.5uV to 2uV, dips to 0.35uV at 900mhz.

Quite impressive, but I would really like to get better sensitivity
at the 70 - 80mhz end. Studying the circuit diagram shows bandpass/bandstop
filters all over the show, so maybe its possible to modify a few to increase

sensitivity here.
I am gathering together the ciruits of the Icom IC-R1, IC-24AT &
W2A to compare the front ends so we will see what comes of this experiment
in the near future.
One other worry was the on/off switch, how do you turn the set off
when the battery is flat. I am concerned about running the battery to zero
volts, hopefully this does not occur. I have been disconnecting the battery
when charging to prevent anything funny happening.
The antenna supplied with my W2A is an FA-1443BB, whats the difference
between this & the FA-1443B, & the FA-4B supplied with an IC-R1.
One more gripe, I dont like the plastic plug/covers over the DC jack,
headphone, external speaker sockets, they should have been rubber as per the
IC-32AT, as I can see already that they will not last very long after prolonged
use. Boy what a moaner, you say, small complaints but this would really have
made it the best. I wonder what Yaesu & Kenwood are going to do to compete
with this???

Interesting, I just bought a Th77a (March 8, 1992), and while I am pleased....
I get real ticked off every so often because the NiCad goes dead and takes my
memory with it. As a matter of fact just happened yesterday.

>[...]The anti-human-rights sentiment that's been going on
>here sure has changed my mind about hams.

Paul,

You forget: the goings-on on r.r.a.m are representative of a very skewed and compeltely non-random sample of hamdom. Even here the most visible selection of our population is the most vocal selection, which is hardly a representative sample. Can someone listening to the AF bands (say 14.313) say that all hams are obnoxious? Does one Jimmy Swaggart mean all christians are scum? Of course not! For every noisy ham (the ones you notice and remember, here and on the bands) there are dozens of experimenters, public service types, satellite bufs, Elmers, and other 'good' hams, to day nothing of the hundreds of just average people.

All,

C'mon gang, the flamefest just makes everyone look bad, from the ham bigots to the gay 'activists', both positions just get more firmly entrenched and hate each other all the more. All the other gays and hams feel the need to make their positions clear and get branded as 'an enemy of the cause' by _both_ sides. Live and let live, it's a hobby for gloz' sake, we're supposed to be having fun! [Besides, if anyone was paying attention], IT`S BEEN RESOLVED, the war is over, the issue is as dead as no-code. [Sigh]

1404. Request for Comments - ACE AR1000

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-24 00:46:09 UTC
From: darnold@felix.filenet.com
Message-ID: <17412@fritz.filenet.com>
Source record: 290628
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Now that I have sold my 100XL, am in the market for a new scanner.
I think I want the ACE AR1000, but am not familiar with it AT ALL.

How reliable is it? Are these things known to break often?

How sensitive is the receiver? A dealer who was trying to sell me
the 200XL old me the AR1000 doesn't do anything really well because
it is a wideband receiver, is this true?

How good is ACE at customer service?

Does it have some frequencies blocked out (like the 200XL does)?

I had my heart sold on the 200XL until I saw this brouchere for the AR1000.
Wow, terrific freq. range.

Would some kind soul comment on the AR1000? Here are my options:

Option #1: Bearcat 200XLT

freq. range:

29.0-29.7
29.7-54
...hole here...
118-174
(oooppps, it's has no 220)
406-512
...hole here - does it matter?
806-956 (good, it's covers the 900 Mhz Ham band, right?)
apparently, Cellular phone is blocked, but it can be modified to RCV
(ah oh, no 1.2Ghz, hmmmmm....)

Price: $250-$300 discount

Option #2: ACE AR1000

Freq. range:

8-600 Mhz
805-1300Mhz

Price: $429 (no apparent discount, buy direct from ACE)

Option #dreaming

ACE AR3000

Freq. range:

100Khz-2036 Mhz (!!!!!!!!!!!!!!!!!!!!!!!!!!!)

Price: $1095

I probably could afford the AR1000, but it would hurt me for awhile.
The Bearcat wouldn't hurt, but I am wondering how badly I need 220 and
1.2 Ghz, and would I care about the holes?

How does the 200XL compare to the AR1000 in price/performance?

Thank you very much for the time.

Subj: Re: Boycott Icom (fwd)

Rusty Carruth cited the SB-102. I think it came out about 1975, and I'm not certain when Heathkit made the last one available. This makes the older ones 17-year-old tube jobs.

One problem that radio had was tuning problems due to the variable cap in the VFO. The "ground" contact for the rotor would get "noisy", and moving the tuning know would cause the frequency to "jitter" and sometimes itr was impossible to locate at a particular frequency. I called Heathkit three years ago about this, wanting a replacement VFO. No luck. I asked about a new variable capacitor. No luck. I eventually concocted a fix for the existing one, but it points out that few pieces of equipment are exempt from the laws of economics. If it isn't economically practical for mfgrs to stock old parts (i.e., they lose money doing so), they won't.

Now let me report the other side. 23 years ago I bought a surplus HP205AG audio oscillator. OFs will recognize the maple-cabinet version that audiologists used to check your hearing. That's the one. I don't know how old it was at the time; perhaps 20. I wrote HP asking for a manual. Even a photocopy would do. Imagine my genuine surprise when they sent not only a nice, new original, but all the upgrades and mods that had been published over the years... and at no charge! Whether or not they could have supplied the variable cap used in it, I don't know; but needless to say, I was very favorably impressed, and continue to be today. I replaced a fried cathode resistor and tube and still have it, and it still works beautifully.

I had mentioned to Andrew Beers (and I think I cc:ed rusty but that was
when you were moving around.. SRI) that the electronic callsign project should
be done in the summer preferentially!! This way the datbase as of september
appears in the Callnook (and therefore also in the CD rom.... and
packet servers... But the callsign servers online would be updated in May/June
providing, not only ease of use.. but an actual update of info, instead
of mearely another means of getting (practically) identical data
(OK OK mid-november vs. end of september.. bue you get the point)
It would also allow those 6 months worth of people who are valid on
marvin but not the callbook to promote there address as valid
"via INTERNET callbook" or somesuch.. generating awareness/publicity...

Please forgive the typos et al., as I am typing one-handed as my left arm
is in a sling (and I am a leftie.. ho hum)

1407. Need coils for Kenwood TS-520

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-24 06:06:05 UTC
From: dale@sequent.com
Message-ID: <1992Apr24.060605.29786@sequent.com>
Source record: 290631

I have a friend with a Kenwood TS-520 that is not presently
operational on 10 or 15 meters. To get it up on those bands
he needs some of the ferrite slugs used for the coils.

I assured him that someone on the net would know how to obtain
new slugs or replacement coils. (I understand that he did check
with Kenwood and they no longer stock the replacement parts.)

Needed parts: (slugs for, or coils)

Drive coil L-5 28 Mhz
Antenna coil L-5 28 Mhz (for both 10 and 15 ?)
Osc. coil L-5 28Mhz

The notation "L-5" is from schematic.

[Note: we should strive for at least one helpful message on where
to obtain the parts per every 100 messages berating Kenwood for
not stocking the parts for at least 20 years. :-) thanks]

Any assistance on getting these bands operational would be appreciated.
The owner is a ships radio officer, so if anyone has questions about
the parts let me know soon as he will be heading out again. This radio
stays on land, so not a big hurry.

73, Dale.

>Would be nice if they picked up 222-225 RX.
>The bottom line, is I am looking for a dual-bander / scanner-replacement.

>Appreciate anything on this new radio (by the way, they said see it
>at Dayton... unfortunately I am not going to Dayton).

The th-77a will receive a lot more than that, not to mention transmit.

From what I hear, the th-78a is supposed to have ctcss scan, alphanumeric
display/memory (IE you can have it display 'W9AAA' repeater), is smaller
then the 77... and fixes a few bugs found in the 77, namely it you won't
erase your memory if your battery goes totally dead while the radio is on..

I'm looking forward to it, personally.

Yes, in other countries we deal with "sole approved importers" and yes
they are very different to those you deal with in the USA

***** THEY CHARGE DOUBLE THE US PRICES ******

Someone in another string enquired how much extra amateurs would be prepared
to pay extra for longer support life. Well we British are charged so much extra
that Lowe/SMC?IcomUK should be able to archive 1 off of every part for each
individual radio sold. I've no personal experience with their service
departments, but two of them are spoken well of by those who have used them.

MY IC765 cost $4800 here, Just imagine the postings if the US switched to
these prices.

I've been working steadily on designing a no-compromise HF transceiver, a several year project. It seems easy to achieve signifiantly better performance than the best commercially available equipment. All the discussion about the suport life of commercial gear has caused me to think more seriously about future availability of parts used. The crystal filter banks are already very old surplus types, but I have a lot of spares and they are unlikely to fail. The RF signal path uses things that can easily be substituted if need be, stages are small and many so it is no real problem to make a new board around a new part if necessary.

Things are changing fast in frequency synthesiser technology, and some excellent new techniques are now possible, DDS and the latest thing, noise-shaping oversampled fractional-N. Both these things are critically dependant on speciallised LSI devices. At current rate of technology change, how long will any such device remain available. I would like to exploit these things, but it may cost me having to redo my synthesiser section sometime should trouble strike, or I may do it anyway to try still newer techniques.

It seems advantageous to have microprocessor control, but this drops me straight into the area where things are going obsolete fastest. As the radio would have quite modest computing requirements, current CPUs and memory devices are already overkill, so I am unlikely ever to want to upgrade the processor power. A failure here in a few year's time would likely force a major re-design for no perceptible improvement in performance.

I am contemplating NOT building any CPU into the radio, but building the radio as a peripheral of a PC, with a simple memory-mapped interface. It may be worth building a control panel as a knob-box as a second peripheral. Going through N menus to adjust AF gain seems likely to be annoying. I also fint the user interfaces with one knob a pain - I keep expecting it to do what it did last time I turned it !

So even with homebrew you are tied in by part lifetimes

You'd need to avoid synthesisers and even freq counters if they use LSI

The counter chip in the last FT101zd's is known to fail, and is irreplaceable adverts are now appearing from folk looking for the old mechanical dial fittings

Radio amateurs have always tried to do everything " for nowt" it is an honourable tradition, and many people have learned a hell of a lot just trying. The change to being just a consumer hobby is a grave loss. Real amateurs don't worry about resale value.

I was looking at HTs from the major manufacturers recently (Yaesu, Kenwood, Icom, Alinco); they all seem to have gone over to 'round edges and pastel colors' styling. YUK!
Also the trend to making them smaller and smaller is being taken to its illogical conclusion. Theres no way they can be operated when wearing gloves. Presumably in Japan, the gloved hand is never seen?
Theres also the stupid habit of defacing the case with all sorts of silly advertising hype; the IC2PE i saw had 'Streamlined compact size; cartridge Battery System; 100 memory channel access; superior high sensitivity; smooth action dial select' emblazoned all over it...
All it needed to finish it off was the ultimate consumer-hype word...
'DIGITAL' !!

I am looking for 800 numbers for the major amateur rig manufacturers that I can call to request literature describing their lines of equipment. I am especially interested in Icom, Kenwood, Alinco, Yaesu, etc... but I am looking for all of the numbers available from all the companies. I will compile the list and post it to the group.

I am NOT looking for the phone numbers of retailers!!! I can get all of those that I want from the back of my QST and other magazines.... I just cant seem to find the numbers from the manufacturers... they dont list them in the 800 directory assistance.

Thanks es 73

1414. Re: Request for Comments - ACE AR1000

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-24 14:29:58 UTC
From: rats@cbnewsc.cb.att.com
Message-ID: <1992Apr24.142958.789@cbnewsc.cb.att.com>
Source record: 290638
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

In <17412@fritz.filenet.com> Dave Arnold states:

|Would some kind soul comment on the AR1000? Here are my options:

|Option #1: Bearcat 200XLT

| freq. range:

| 29.0-29.7
| 29.7-54
| ...hole here...
| 118-174
| (oooppps, it's has no 220)
| 406-512
| ...hole here - does it matter?

This is the UHF television band.

| 806-956 (good, it's covers the 900 Mhz Ham band, right?)
| apparently, Cellular phone is blocked, but it can be modified to RCV

However, the scan increment of 12.5Khz does not match the North American
cellular spacing of 30 khz, causing a permanent mismatch of received
frequency vs. tuned frequency.

|Option #2: ACE AR1000

| Freq. range:

| 8-600 Mhz
| 805-1300Mhz

| Price: $429 (no apparent discount, buy direct from ACE)

Get yourself a copy of Popular Communications and Monitoring Times;
firms are discounting the AOR AR-1000XC and Fairmate HP2000 (From
EEB) in the $380 range. The Fairmate, a relabeled AOR, gives you
three antennas (SW,UHF,VHF) instead of the single rubber duck that
AOR gives you.

As imported, the AR-1000XC frequency range is 500khz to 1300mhz.

Features include:

1000 channels
AM/FM/Wideband FM
Selectible channel spacing from 5 to 995 khz; also any
multiple of 5 or 12.5khz.

10 banks
Tuning knob on top of the receiver.
10db antennuator switchable via button on top of receiver.
Priority channel

Drawbacks are:

Really crummy human interface
Delay of 2-sec that is non-removable
Some birdies (or a LOT, depending on the frequency range)
Intermods, but a _LOT_ less than Unidens

Good stuff:

High IF frequency in the 500 Mhz range means that you
don't have to tolerate images.

Sensitive.

Probably the best handheld urban scanner.

BUT, the AOR AR-1500 is already being sold in the UK, so it should be getting to US shores soon enough. The AR-1500 adds SSB to the capabilities of the AR-1000; the scanner looks like a somewhat taller version of the AR-1000 and with better knobs. Price is not known. Supposedly has other features as well (does it make DELAY a switchable item?).

1415. "Ham Testing Fraud"

Newsgroup: rec.radio.amateur.misc

>This really pisses me off!
>73 de Michael KC6UFR

This sting was run by the ARRL Official Observer and the Asst
Section Manager for the Los Angeles section. Both the Asst Sect
Manager and one of the undercover hams are members of the club
I belong to and they feel they have overwhelming evidence. The
VEC involved was W5YI and, to their credit, they immediately
lifted the accreditation of all the examiners involved. The FCC
is also investigating other exams run by that examiner-in-charge.

None of the VEC's condone cheating, but they need our help in
identifying the problem sessions. This sting came about because
hams in the LA area were concerned and the ARRL Official Observers
were willing to set up a sting. They arranged funding so their
undercover person could enroll in the class. She attended with
a tape recorder in her purse. If I felt there was a problem,
I would contact the VEC involved and talk to them. I would
probably also talk to my ARRL section manager and OO's. As
a ham class instructor and as an examiner, cheating really
bothers me too--I also studied hard for my license!

The FT-470 is excellent in virtually every respect. I had one for years,
and it operated flawlessly. It has all the bells and whistles, is small
and lightweight, and is relatively inexpensive. The only weakness is in
the speaker; it's so small that receive audio levels are no more than
adequate. Using an external speaker-mic solves the problem. The speaker
is ok, but no more than ok. Other than that one relatively minor
annoyance, the 470 if a first-class rig, and an excellent bargain; you can
get it most anywhere for well under $400. There is a very long list of
mods and keystrike sequences for all sorts of weird and wonderful things
like extended receive up to something silly like 1Ghz, etc. It will even do cross-band
repeating, right out of the box with no mods at all! You won't
regret getting a 470.

>> Steve, let's take a poll. Outside of antique collectors, how many of
>> us make everyday use of radios, or cars, that are over ten years old?
>> Yeah, there are tube forever guys out there, but I suspect the majority

i'm not a tube-forever guy, but i know a good quality, rugged radio when i see it, and most of those today are older, tube-type radios. maybe rugged quality isn't something that appeals to the general ham community today, but i think that it does, and if we don't start voting for it with our dollars it is going to continue to get farther and farther away from us.

there is another issue here... manufacturers cannot afford in some sense to make radios that are "too" durable... eventually the limited amateur market might become saturated with used radios, and the manufacturers would be unable to sell new radios. i acknowledge this problem, but it doesn't change the fact that *i* want a good, solid radio... something that will survive a few trips in the back of a truck to field day, etc.

>> of active hams have bought a radio in the last two years and plan to buy
>> another in the next two years. By the time the average ham radio is
>> ten years old, it's likely been through the fleamarket two or three
>> times. Do you really expect factory support for third hand junk?

so what?

will your fine "modern" radio *make* it through the fleamarket several times? maybe you don't care if it does, but i and many others do. i got a swan 500cx at a hamfest for $120. in its day, this radio probably cost $1k+ in 1992 dollars. for $120, i am able to participate in HF on my limited budget, and i think that there are many other hams who also have limited budgets... e.g., students... the important pool of *future* hams.

Yes, the UHF "T-Band" (~470-512Mhz) includes channels out of the UHF
television band; however, I don't know if the FCC issues television
broadcast licenses on those lower channels anymore.

Does anyone know of any operational television stations that transmit
in the UHF "T-Band" currently?

1425. Re: Antenna/feedline impedance question

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-24 17:59:32 UTC
From: myers@hpfcso.FC.HP.COM
Message-ID: <103360078@hpfcso.FC.HP.COM>
Source record: 290649

The notion of characteristic impedance requires a reasonably fair amount of background discussion before one can REALLY get a good handle on it, but here's a short pointer in hopefully the right direction:

Imagine you have a 10V voltage source connected across a 10 ohm resistor:

```
switch
____/_________
| |
+ \
/
10V \ 10 ohms
/
- |
|____________|
```

If I close the switch, what current flows? Now, anyone who has progressed beyond the simplest of DC circuit theory will instantly jump up and scream, "1 AMP!!!!!" And this is, of course, the correct answer, at least as far as I've described the problem so far.

But now let's change things a bit. Suppose that I tell you the resistor is located a mile away from the source (connected by the ever-popular zero resistance wires), with the switch still back here at the source. You close the switch NOW - what's the current 1 microsecond from NOW? Some will still shout, "1 amp!," but others may realize that the resistor is sufficiently far away so that even light couldn't get there in a microsecond, and so we've got a puzzle. How does the source "know" what current to "start sending down the wire?"

Well, the reason that the speed of light ISN'T infinite (at least, the simplified reason that will serve our purposes here) is that there must ALWAYS be inductance and capacitance in ANY circuit, even one made outta these patented zero-resistance conductors; if a current flows in a conductor, then there must be a magnetic field around it, and that means inductance. If two conductors are at different potentials, an electric field will exist between them, and that means capacitance. Any physically realizable circuit MUST have these qualities, and their values will depend on the arrangement, shape, etc., of the conductors we're using. The impedance the source "sees" during these first instants after the switch is thrown depends not on the resistor, then (it's too far away), but on these properties of the conducting path. This is called the characteristic impedance, and we can design and build cables for specific char. impedances by selecting the proper geometry, dielectric materials, and some other factors.

Now, why this imepedance is important, and why it should match the load, is a slightly more complicated topic. But consider the following - what if the char. impedance for the ciruit above is, say, 50 ohms? OK, the source will "launch" a current of 200 mA (10V/50 ohms) "down" the cable. What happens when this 10V/200 mA "signal" runs into a 10 ohm load. Ohm's Law is NOT going to be satisfied, unless something happens. What? (Think about it a while, then go find a good basic text on transmission lines.)

>> Steve, let's take a poll. Outside of antique collectors, how many of
>> us make everyday use of radios, or cars, that are over ten years old?
...
>> Gary KE4ZV

My all-solid-state, digital readout Drake TR-7 is over 10 years old.
So is the MN2700, L75, PS7, SP75, and P75. For VHF, I have an
over-10-year-old Drake UV-3 144/220/440 MHz radio. I'm pretty sure
both of my 2 meter HT's are over 10 years, too: An Icom IC-2AT and
Kenwood TH-215. For packet, I use a Johnson Fleetcom with a GLB
channelizer (both a LOT more than 10 years old.) I'd guess my
packet TNC and computer are about the only ham gear I have that
are LESS than 10 years old!

I may be a bit atypical, but I bet many, maybe most, hams have at
least one peice of gear more than 10 years old.

(On cars, I bat 50/50: a 1987 Accura Legend and a 1972 Ford van.)

>You most likely have the diode in the reverse part of the circuit in backward.
^^^^^^^^^^

I have gotten at least 4 e-mail responses that suggested this, but a
backwards diode does not explain why I get negative AND POSITIVE readings!!

When I adjust the "NULL" adjustment as specified in the calibration
procedure, the meter reads POSITIVE.. But my NULL takes it down through
zero to negative. How can a diode do that???

I checked the board and all 3 diodes are installed correctly and appear
to be "good".

I did not build this HM-102. I am just trying to make the beast work :-)

I have noticed this phenomenon, too. Occasionally, (usually when feeding wierd random-length end-fed antennas etc.) I notice that one of my cheap SWR meters will read more reflected than forward power. I have always chalked it up to common-mode (shield) feedline currents getting into the poorly-shielded SWR meter case and getting rectified by the "reflected" diode.

-=-=-=-=-=-=-

From aviator@Athena.MIT.EDU Wed Apr 22 14:03 EDT 1992

I have a Kenwood TH-27A and it is a superb radio. I follow the market
very closely, and am convinced it is still the best 2m handheld around.
The only possible exception is Standard's C168A. It is available
from the Austin Amateur Radio Supply for $319, much cheaper than
Icom's 2SAT considering that it comes with CTCSS and DTMF decode/encode
built in. HRO will match Austin's price if you ask, btw.

However, I have heard rumours of a Kenwood TH-28A which is (presumably)
going to replace the TH-27A. At this point prices for the TH-27A may
drop, and you'll have the choice of buying it or the new TH-28A. There's
no telling when we'll see the TH-28A available in stores though; maybe
we'll know more after Dayton.

If you do buy a TH-27A, I can recommend the following accessories:
SMC-33 speaker mike with remote control buttons (a must for mobile operations)
SC-31 soft case (a must for radio protection)
BC-15 desk top charger (a must for battery management)
AEA hot rod antenna, or Larsen kulduckie, or other telscoping antenna

The Kenwood TH-77A on the other hand is nowhere near as good. Also, it
is to be replced by a TH-78A. For a dual band handheld I would recommend
the Icom 24AT which is available for $399.

If you have any specific questions, don't hesitate to ask...Joakim

From Daniel_C._Chen.Wbst129@xerox.com Wed Apr 22 17:32 EDT 1992

Hi,

I just got the TH-77A and I love it. Of course this is my very first HAM radio
so I don't have much external experience. It just recently went on sale at
most HAM radio outlets and with the original price being so high I thought it

was a good deal. It also had features I liked, like CTSS encode/decode, paging, DTMF, lighted keypad, etc. I basically looked at Kenwood, Yeasu, and Icom. At first I was planning on buying the Yeasu (FT-470), because the Kenwood and Icom (24-AT, and W2A) were more expensive. But then the Kenwood went on sale. The only bad thing so far with the Kenwood is that I haven't found out if I can modify it for a broader recieve. Of course I haven't even had the TH-77A for a week yet, so my opinions might change when I make my first contact. Is this what you were looking for? Please feel free to ask any other questions.

Dan

-=-=-=-=-=-

From lng@Bonnie.ICS.UCI.EDU Thu Apr 23 00:57 EDT 1992

I bought my Kenwood 77A two months ago. The radios I considered were Icom 24AT, and the Yaesu FT-470. I decided on the Kenwood because the HAM radio store was having a sale on all Kenwood products. But if you want something that can double as a scanner, choose the Icom 24AT but it will cost you more money. But if you want the best bang for the buck, choose the Yaesu. I chose the Kenwood because of it's size. It was smaller than the Yaesu. They all perform the same.

-=-=-=-=-=-

From wabash!rotuma.acuson.com!collins@fernwood.mpk.ca.us Thu Apr 23 11:30 EDT 1992

I got my ticket just over a year ago and bought a TH77.
Overall, I am very happy with it. The beast works reliably (no problems at all), intermod is no worse than with other rigs with wide receivers. The lighted keypad is nice.

On the minus side, the REV (switch repeater input with output, so you can listen to the input) is a shifted (F-key) function, which is mildly annoying.

On the plus side, when the Icom W2A came out, prices on the TH77 dropped a from around $580 to around $4xx. At that price, I think it is a good deal.

Other thoughts: the price of the accessories is outrageous, but that is true of all brands. Also, some brands can use Icom accessories (i.e. you can find stuff at flea markets). Kenwood is not compatible with Icom.

Final evaluation: if I had to make the same decision again (TH77 -vs- Icom 024sat), I would still buy the TH77. Against the W2A, I'm not so sure, although the lower price makes it more attractive.

Two cautions: I'vew seen the TH77 advertised at AES as a "closeout" - it may be about to be obsoleted by a new model. Secondly, I've heard a rumour that the W2A, when used on 440 at high power FROM THE

CIGARETTE LIGHTER ADAPTER ONLY will get the PL screwed up. I don't
know whether this is true, but if you are thinking of the W2A, check
it out before you buy,

Hope this helps. Good luck,

From: svec@rtsg.mot.com (Larry Svec)
Newsgroups: rec.radio.amateur.misc
Subject: New Kenwood HT 78A

Just saw on page 3 of latest QST that Kenwood has a new set of
5 radios... has anyone bought one of the 78As yet? What features
does it have, particularly in the area of expanded receive...
e.g. a number of dual band HTs now adays cover (+/- a few megahertz):
118-136 AM 136-174 FM 420-500 FM 800-950 FM
I wonder if the 78A can do all thhat (I believe the 77A had a few
holes in the receive around 460 and again around 850 or so while
the Icom W2A more or less did all of the above and the new ALinco
does much of the above with a few holes in the coverage).

Would be nice if they picked up 222-225 RX.
The bottom line, is I am looking for a dual-bander / scanner-replacement.

Appreciate anything on this new radio (by the way, they said see it
at Dayton... unfortunately I am not going to Dayton).

From brian@tredysvr.tredydev.unisys.com Thu Apr 23 18:05 EDT 1992

I have had a Th-77A since last July. The CTCSS decode (the squelch breaks
only if the repeater I want is sending its 'pl' code out) falses a lot.
The supplied (rubber duck) antenna is very poor on 2 meters. Otherwise a
nice radio. Not too many active 440 repeaters here west of Philly so a the
27A may be fine at a much lower price, presuming its otherwise usable.

-=-=-=-=-=-

From svec@void.rtsg.mot.com Fri Apr 24 09:26 EDT 1992

I too was almost going to buy a 77a but the reason I am waiting or will
get a W2A (Icom) is I hear that the 77a has a few holes in the out of
ham band RX (e.g. around 460MHz and again in the mid-800 MHz range)
Those two ranges are 460-chicago pd mid-800-police band conventional
and trunking. If you don't care about out of band RX that much, the
77a is a great radio (so I understand, I have never used one) and they
are going pretty cheap now-adays.

I have the '77 and bought it over the ICOM 32 or the alinco 570[?] [last
year, feb] or the ICOM 24... Better feature set, easier for me to
use. Much less intermod than on a W2A, able to dual-band recieve unlike
the 32. All in all a wonderful radio. My friends have everything
mentioned above but the alinco rig, so I've been able to do a lot
of comparison "in the field".

Source record: 290662

OK, having recently done a side-by-side of a used 735 with my 745, I'll throw in these observations.

Things I like about the 735:

Compact. Much nicer audio than my 745. Both a preamp and an attenuator, though the attenuator is pretty intense (supposed to be 20db). Nice quiet break-in keying (used to the loud, slow relay in the 745) and quick T/R switching. Better skirt on the stock SSB filter.

Things I didn't like about the 735:

No IF filters in the 2nd IF, just the 3rd; I have cascaded 500Hz filters in the 9 and .455 MHz IFs of the 745, and the audible skirt cutoff is better than the lone 250Hz filter on the 735. I would also assume having a wide 9Mhz IF would limit performance in crowded CW condx. No IF shift, just PBT...yes, I use PBT more often than IFS, but sometimes IFS is useful. I think sensitivity is better on the 745, but the 745 preamp is actually overkill for HF and rarely (but occasionally) useful. The S-meter on the 735 I was trying was very non-linear: very little between S7 and S0 (the 20db attenuator killed an S7 sig down to S0 or S1). Slider controls rather than knobs (but that's partially how they get compactness). Only two-position FAST/SLOW AGC rather than continuous.

I think I recall the ARRL lab reports show better IMD performance and sensitivity from the 745, but better blocking range on the 735. All that said, everyone seems to really like the 735. I decided not to switch to it after the side-by-side, but I think it's a great little rig for the money. Certainly if I were going to buy a new rig for $1k, it would be my choice.

Hi Martina,

Packet is one option, another is to see if there is a remote base or crossband repeater with 10M FM capability at each end. [I know there are a couple in Florida] --

Another option is to get good 6M SSB setups and wait for openings.

Finally, you could always use the OSCAR satellites.

What's your serial number? My wife and I also each have TH77As, with serial numbers in the 30500xxx range, and neither has experienced this problem. Several times I have run mine down to the point where the display starts to flash (and it doesn't have enough power to turn off :-), and she once ran hers down even past that point without loss of memories. It would seem that it isn't much different than having no battery pack attached at all.

1446. 2m-to-10m crossband operation?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 01:48:22 UTC
From: cberthel@cc.utah.edu
Message-ID: <1992Apr24.194822.1@cc.utah.edu>
Source record: 290669

I was in Mobile, Alabama last week on a business-related trip and heard some interesting ham activity. Apparently they were doing 2m-to-10m cross band communications. A ham in California who was talking on the 10m band was talking to a ham in Alabama who was on 2m. How does this work? I'm a no-code tech so I can't operate HF. But could I use 2m-to-10m cross band repeater? Thanks for your replies.

>with operation restricted to one day in a week, we were receiving a couple
>of thousand cards every month via the buro. I know a lot of people would
>have been upset at not getting qsl replies via the buro.
>

I'm not sure I understand. What "costs" are involved in replying
to bureau cards? The cost of printing the cards, the cost of the
operator's time in filling them out? I can understand not being
able to afford direct return postage, or being able to send a
full-color fancy QSL card, but to decide that one can't afford a
simple one-color card (or a xeroxed piece of paper) seem to border
on unethical. Did you tell people of this policy during QSOs?

I believe that a statement of "I don't reply to bureau cards" would
be considered as grounds for disqualification in most of the major
DX contests, by the way.

"FT650 NOISE BLANKER MOD"
From: VK4TUB@VK4AFS.#NQ.QLD.AUS.OC
To: VHF6@ASIA

If you are unhappy with your FT650 noise blanker here is a quick mod.
The mod involves shorting diode 4013 which will increase the gating
time of the agc line to the noise blanker.
This is located on the if board.
This will inprove the noise blanking by several S points under heavy
power line noise.

1450. Special Event Station - 2 MAY 92

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 04:33:18 UTC
From: dm8981@eecs1.usma.edu
Message-ID: <4067@eecs1.usma.edu>
Source record: 290673

The Cadet Amateur Radio Club at West Point, New York
will conduct a special event station using club station W2KGY on
2 MAY 92 to commemorate the 190th anniversary of the U.S. Military
Academy.

Operation will be conducted from 0900 - 1700 EDT (0500 - 1300 UTC)
in the following frequency bands:
Phone CW
3.85 - 3.925 3.525 - 3.600
7.23 - 7.26 7.100 - 7.150
14.23-14.30 14.025 - 14.100
21.30-21.38 21.10 - 21.20
28.30-28.50 28.00 - 28.10

AMSAT Mode B (AO-13) When available.

A special QSL card will be available for all confirmed contacts.
An SASE must accompany your card. QSL Manager for this event is
KE2WF.

Hope to hear you on the air !

1451. Radio Shack - America's Technology Store!

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 04:54:40 UTC
From: 0004788818@mcimail.com
Message-ID: <05920425032150.0004788818NA1EM@mcimail.com>
Source record: 290674

A few comments about the lack of shared data among the Radio Shack stores (i.e. their mailing list database). I work at a small dealer store and we have over 500 names in our system. Now for the 7000 stores, that's about 3.5 million names (an underestim ate) and at about 40 bytes per address, that's over 100 megabytes for just the data file... I can see it now... "OK, Mr. Smith we'll have your receipt out in just a half hour." as the computer finds the 766 listings of Smith... :-) Not to mention the ma intenance required (and "modem time" phone bills)

Then again, they could be centrally stored, but how'd you make it practicle for 7000 stores to access it?

--> another "funny" anecdote: we are still receiving "late date" sheets which list the expected dates for availability of new products that are listed in the '92 catalog. The '93 catalog will be out in about 4 months... talk about vaporware!

1452. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 05:39:40 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <1992Apr25.053940.25143@afit.af.mil>
Source record: 290676

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.misc. This week's elements are provided below.

I am posting this for a friend who does not have access to the news but can receive email. Please reply to the address at the end of this article. Thanks.

QUESTION: Does anyone have contruction or design info for 80/75 meter transmitting loops that are about 10 feet diameter?. I believe there was an aricle published in QST or Ham radio magazine in the last 5 years that discussed this problem. Has anyone built one??. The antenna I'm thinking of is similiar to a DDDR but is not worked against a ground screen.

1454. Re: Yeasu Battery Clips

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 08:39:31 UTC
From: michaeln@hpcvnb.CV.HP.COM
Message-ID: <44810017@hpcvnb.CV.HP.COM>
Source record: 290578

I don't have the number with me. but about a year or so ago i had the
battery clip on my wifes ft470 break. i called yaesu parts and service
i california and they sent me 3 of them for free. at the time they said the
price was like .45 each. i'll see if i can find the number.....well a quick
phone home and the number i have is 1 800 633 4455. its been about a year
since i used it but if it's not any good try directory assistance. they
should be able to guess what area you need by the 633 in the 1 800 number.
when they sent the parts to me, they just put them in an envelope and
mailed them. awhole lot cheaper than shipping ups. good luck. mike nason

Message-ID: <44810018@hpcvnb.CV.HP.COM>
Source record: 290579

Hold it everyone. I must retract my first response to this base note.
it's 3 am so i decided to see if the 1 800 number was still good. it isn't
but, after scrounging around for more numbers i found a couple.

try 1 800 244 9237. i tried this number (at 3 am) and got no response but !
atleast i didn't get an intercept recording like i did for the old number.

also, i have some non 1 800 numbers
213-404-2700 yaesu, inc. main number
213-404-4884 yaesu, inc. service
213-404-4847 yaesu, inc. parts

these numbers were copied from an earlier post but i know that the parts
number was good at one time because i have used it personnally. (if that counts
for anything)

be sure and be using a touch tone phone when you make the call. actually i think
nk
it works with out one but don't quote me on that. "most" of these systems have
someone who will pick up sooner or later but not all of them do.

as to yaesu having old parts. in may cases they do. i was able to get "simple"
parts for a tempo 1 (made by yaesu) such as a new vfo knob, power cord etc.
and i think the tempo 1 is about 20 years old.
good luck. 73's mike nason ka7hbb. good luck. 73's mike nason ka7hbb.

> or the keeper of the main database, or is the keeper of the database
> the FCC ?

The database keeper is the FCC. Send a 610 in changing your address.
Shame on you for not doing it sooner. Other than having your QSL
cards go to the dead letter office, had you been operating and gotten
one of those QSL cards from the FCC, and your forwarding order had
expired, you may have incurrred violations and not known it.

I too dislike the current trend in "styling" of most things...

Everything looks like a loaf of bread dough that has been squished and poked. Neither cars that travel at ordinary speeds on city streets nor amateur radios need to look like the amorphous blobs with knobs tossed in in a haphazard pattern. Yes, I know, these are supposed to be functional designs based on human needs...Baloney! They are nothing more than the bad dreams of "stylists" who are overpaid cultural drop outs. The problem is that they absolutely control what we receive in the marketplace. This problem has been endemic in the world of "fashion" for years...prime example: those absolutely stupid shoulder pads that pervade every article of women's clothing (my wife really likes stacking a padded coat on top of her padded business suit on top of her padded blouse on top of her padded...ad infinitum! And to top it all off, people actually BUY the stuff --- which only prods the "stylists" to do even worse "designs". GAG!

My next soap box outpouring is against another "trendy" item: ham radios that try to be a DC to Light do everything box for everyone. In the metropolitan area where I live, I've tried out several of the "extended range" dual band mobile rigs...not a one of these super scanners has any intermod rejection capabilities. Trying to listen to local 2 meter ham repeaters is like listening to the Tower of Babel -- with all the paging tones, paging service voices, police, fire, business radio services mixing together in the non-selective front end and emerging on just the frequency that I want to quietly monitor. When I inquired to find out about dual band radios with a tightly restricted frequency range for ham use only, I was told that manufacturers don't make that kind of radio any more -- because they aren't popular. I understand that only Radio Shack offers a frequency limited HT on a single band...well that is going to be my next radio when I need another HT. In the mean time, does anyong know of a good dual band mobile rig that is free of intermod? Am I the only person in the world who wants such a radio?

Hmmm, in order to save society, maybe we should kill all the "stylists" before the lawyers?

Cheers, Bill.

1458. Which freq. counter to buy?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 17:11:22 UTC
From: rja@batcomfs.Eng.Sun.COM
Message-ID: <kvj4lqINNd84@exodus.Eng.Sun.COM>
Source record: 290582

The title says it all. I want to buy a freq counter for use
with my scanner. I'm thinking of pulling out the stops and
getting an Opto. 3000 model, but I'm wondering whether or not
I'd be happier with the 2600. I'd like to hear from anyone
who's used Opto. freq counters. If you've used the model 104 (?)
tunable pre-selector I'd particularly like to hear about that.
If you think other manufacturers are worth looking at, please
list them, and why you think they're better.

Thanks.

1459. transmiter fundementals?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-25 17:18:48 UTC
From: toney@milton.u.washington.edu
Message-ID: <1992Apr25.171848.1214@u.washington.edu>
Source record: 290583

A while back I posted a article asking for help in finding a amp chip
to boost the signal from a transmitter. I wanted to thank all that responded
with information or offers to help. My immediate proiablym however is that I
understand the basic principals behind a transmitter but am totaly at a loss
as to the equasions and fomula thatve me my values of the parts (i.e resistance
capactence and inductance,) so that I can vary my frequency, watage.. exct..

I found this circut in an old copy of radio electronics and thought I
could use it to clarify the specific questions that I wanted to ask. Any
nsight that you can give me as to the equasions to get the values of a general
transmitter or tips on amplification/ signal clarification for this transmitter
would be greatly appreciated. My end goal is to design a FM transmitter with
about 40 to 100 wats o power Mhz. If that
workes as I want I am going to build a ham rig so tips of that nature would be
appreciated as well.

I hope this does not sound like I am asking the net to do all the work
I have invested a lot o time brushing off old books and diggin in to understand
how this works but I need a little help. Again I am sorry if this post offends
any of you.

Thanx in advance for all your help.....

NIN___
TBB___

toney@milton.u.washington.edu

My main questions about FM transmitters are:

1: some one recently told me that the ratio of my frequency/inductance/capacit-
-ance was (with 2pieF = w) w = 1

\/ LC
They were able to explain partialy how that works but I still don't
know does this alwas work? If so are there other formula to guide by.
mostly what I am looking for is the equasions that give the part values
that inturn give the frequency. I am sorry that thesr are rather stupi
proiablems but I am a little confused. (and rapidly getting more so)

2: I think that the above equasion will give me the alterations nesicary to
change the inductor from a icoil of six wires to a ferrite rod/lopstick
.. will that then give me the new capacitence? Will I have to alter the
values of any other parts as a result.. I suspect so but HOW do I
determin there new values.. (dont mind being pointed at a few books
if that is the easiest way to answer).

3: I *think* that to put my amplifier in to this circit I would replace Q2
with my amp or amp chip... but what effect would that have on the rest
of the circit? Is that the easiest way or even the right way to amp
my signal????

4: This is the realy stupid one so brace yourselves.
I still dont realy understand the total inner workings of a tanked
oscilator. I think I see how C7 would create the carier frequency with
its charg and discharge, but I dont see how everything left of Q2 is
being powered. I understand and can recognise the operational bias on
Q1 but as I understand it the whole transmiter is driven by the
changing voltages acrost R1, R2, R4,and R7. How does this drive the
mic. I just see the current as running straight to the ground here?

5: If I do build a small transmitter like this one would a regular audio amp
be able to increase my signal strength? If so what is the ratio, or is
there a equasion to determine it (would a 15 wat audio amp give me
a 15 wat signal?)??...

6: Lastly can I convert the schematics I have been reading for short wave
amplifiers to these FM bands..???

From: djenkins@wang.com
Message-ID: <bna32e.f4c@wang.com>
Source record: 290584

```
Two and 1/2 weeks ago I passed my novice test. Today I went to take the Tech
exam. Since I failed to keep a copy of the 610 form, I had to re-take part
2 befor they would let me take 3A. No problem. I got one wrong on Part 2
(just like the first time), then I got one wrong on Part 3A. (2 or more wrong
or zero wrong is OK, but, one wrong BUGS me!!!). Then they said "Why not try
Part 3B?"... I PASSED!!! (Then "for the experience" I tried the Advanced exam.
I failed miserably! But since I hadn't even seen the book I wasn't too upset!
Now I have to start working on my code again.

When I started out I was going to go for the no-code tech. I don't like CW
(at least not yet). Then I got into a class that was teaching old fashioned
novice stuff, so, what the heck, I learned the code. Then I started working
on my Tech. Now that I have 3A to my credit, all I need is the next level (13
WPM) CW to get my General class. After that, I would obviously want to go for
the advanced since that would only be another written exam away... I think I'm
hooked. My wife seems to agree (enthusiastically). I asked her if she was
interested, but she said it was a toss up on the unpleasantness scale between
that and cleaning out the kitty litter. Oh well, I tried.

BUT I CAN'T DO ANYTHING YET BECAUSE I'M STILL WAITING FOR MY NOVICE TICKET IN
THE MAIL!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
At this rate I could be an Extra by the time I can key up!
```

>band repeater? Thanks for your replies.

Cheryl,

Remember, you only need to be sure what you personally are transmitting
is authorized to your class of license. If a higher-class licensee
re-transmits your signal, that's his/her business (and legal, and quite
common).

My advice (with a warning attached): go for it, and have a ball. The
warning is this: you may get hooked, and will have to upgrade to get
your own HF setup!

Have a ball, 73,
Dave KZ1O

Body handling: HTML body converted to readable text

25 APR 92 22:07 GMT

Greetings Fellow Amateurs:

I am having a very hard time in making up my mind on what type of HT
to purchase. I am needing one that not only for dual band amateur use,
but one I can use on the job. I am a Police Dispatcher/Parking Enforcement
Officer for Morehead State University in Morehead, Ky.
I am also a Member of the Morehead/Rowan County D.E.S. Rescue Squad.

The Problem: The University Police uses 2 freq. F-1: 159.090/F-2 158.970
The Rescue Squad uses 462.975 mhz. down

I need an HT that I can Transmit the University Freqs. and monitor the Rescue
Squads Freq. and will scan with a Priority channel.

I was going to get the FT 470 but I don't know..

If you can help in locating a ht that is able of doing this MY THANKS.

I do not need anything involving the Aircraft bands. I have that on my
home scanner and it is not used.

Please reply Direct to avoid heavy traffic on the net.

My Thanks

Tim Wright / KD4??? 3 weeks and counting

From: vmp@fuug.fi
Message-ID: <VMP.92Apr26034051@techno.fi>
Source record: 290591

Anyone out there familiar with the ICOM IC-765 PLL adjustment?

I recently purchased the CR-282 high-stability crystal unit for
my IC-765 and since then I've been unable to zero-beat WWV (or
high quality signal generator) with the calibrator control.

By following the instructions in the IC-765 service manual (6-2)
I adjusted the calibrator control to 3 VDC and reference frequency
exactly to 60.00000 MHz, but the problem still remains: the actual
operating frequency is too much off for the calibrator control. :-(

Am I missing something here? My local ICOM dealer has no clue.

Thanks in advance,

Vesa, OH8NKQ

[closure deleted]

He may have been a bit more adamant that the context requires,
but putting higher selectivity closer to the antenna rather than
farther is usually better if you have a choice. The reason is
that putting selectivity closer to the antenna protects more
stages against overload from signals you can't hear -- that is,
signals that make it through the transceiver's "roofing" filter
-- usually a few tens of kilohertz wide up at the radio's first
IF -- but that remain outside the passband of the narrower
filter.

This, not the possibility of activation of the receiver AGC, is
the answer to your question, "Why would it be otherwise?" But the
acid test is how good it sounds to you, and if it sounds good, it
is good. Would you improve the radio's ability to withstand
overload from strong adjacent signals by installing a 500-Hz
filter at the higher IF, too? Yes, but perhaps you might hear the
difference only in very demanding operational with gainy
antennas.

I guess I should have said that for the last two years, we
have been growing by about 9%/YR.

The "W5YI Report" dated April 15,1992, page 5, shows the following numbers
of licenced hams in the US:

YEAR 1989 1990 1991 1992
OF HAMS 448716 465577 506789 553629
% ABOVE PREV. YR +3.0 +3.8 +8.9 +9.3

Since the introduction of the nocode tech licence, there has been a 1034%
increase in the # of tech exams given, and a 21% increase in other class
tests. (See, the no-codes ARE upgrading!) There was a 35% decrease in
novice tests given. Since the introduction of no-codes, we've grown by
an avg. of 3565 new hams/month. The number isn't dropping much either.
last month we grew by 4092!

PLEASE, I'm not trying to stir up a no-code hornet's nest on this network!
I've heard enough discussion of the no-code contraversy on local nets to
make me puke!

WOW, how often does one get challanged for resources and have stats
like this available. (SPECIAL TNX TO W5YI REPORT)

1472. Satellite TV rcvr schems

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-26 05:29:37 UTC
From: rrw@naucse.cse.nau.edu
Message-ID: <4960@naucse.cse.nau.edu>
Source record: 290596
Cross-posted to: rec.radio.amateur.misc,rec.video.satellite

I'm badly in need of some schematics for some orphan
satellite tv equipment:

Janiel SP 2000 stereo processor
Royal-Sat Model BR 300 receiver
Toki Model 99 receiver

Now, before I spend many bucks calling all over the
country trying to locate prints on these, can someone
point me to a place which might carry them or be willing
to sell a copy (no, SAMS doesn't do satellite receivers).

Particularly there are a number of people on the HOMESAT
mailing list wanting the description of the innards of the
Janiel unit since it's now showing up surplus...

THANKS

1473. RACES Bulletin #219

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-26 05:56:50 UTC
From: enge@almaden.ibm.com
Message-ID: <9204260556.AA05443@ucsd.edu>
Source record: 290597

Msgid: $RACESBUL.219

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.219 DATE: April 27, 1992
SUBJECT: MGT: Principles of Management for the Radio Officer

The first principle is that of planning. The RACES plan is what
first comes to mind. Is there one in effect and does it reflect in
general context that of the model plan in general use in the State?
But planning goes further than that. At one time there was a planning
document by FEMA for jurisdictions, called ECDP for Emergency
Communications Development Plan.
That plan had 3 parts:
1. A complete communications inventory, listing all two-way radio
systems and any others with which a well planned and equipped
Emergency Operations Center should have to communicate. This meant
all the internal and neighboring public safety systems, utilities,
transportation, RACES, CAP, CB, GMRS and others.
2. A complete identification of deficiencies: everything you
didn't have, but should have. Few jurisdictions have everything they
need.
3. A complete acquisition plan, which listed budget estimate, and
in what fiscal year the items were to be acquired to correct the
deficiencies. Obviously, such a planning document requires annual
updating.

EOM

RACES Bulletins are archived on the Internet at ucsd.edu in hamradio/races
and can be retrieved using FTP.

1475. Radio Shack - America's Technology Store

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-26 14:07:09 UTC
From: n2gj@phsbbs.princeton.nj.us
Message-ID: <m3cuJB2w164w@phsbbs.princeton.nj.us>
Source record: 290599

Jeff L. Myers stated: "How'd you make it practicle (sic) for 7000 stores to access it [the data on all 35 million customers]?"

Why not use a client-server approach with data for each store stored locally, data for a region stored on a LAN server DB ("Mr. Jurrens are you registered as a client in this region?") and the BIG database maintained by feeds fro the regional databases? It seems to me that that would make the best use of technology that is readily available today.

I truly abhor the present system and its immediate predecessor. 73,

There are ham HTs that can do this. Problem is, it ain't legal.
University "permission" has nothing to do with it. Ham HTs are not type accepted
for these other services, and type acceptance is required by FCC.

>I was going to get the FT 470 but I don't know..

The FT470 will receive on both the frequencies in question. The
out-of-band transmit is the kicker...

From: ron@pilot.njin.net
Message-ID: <Apr.26.12.12.25.1992.8430@pilot.njin.net>
Source record: 290603

While the Yazoo Ft470 can be modified for extended receive (and
furthermore) transmit on your police frequencies. It will not
conveniently receive or transmit on 462 without giving up 440-450
which you proably would like to keep. Note I said conveniently.
If it's only one frequency, there's a way you can get that into
a memory with a rather involved kludge.

The more involved problem is that it wouldn't be legal to do this.
While you can use any sort of radio that you can construct or convert
for ham use (that's why you were given a test on radio fundimentals,
contrived as it was), radios for commercial use must be type accepted.
The FT470 is not type accepted, primarily because Yaesu has not
interest in doing so since that's not the market it's setlling them
into, but also because it would not meet the requirements. Since
your typical commercial or public service user is regarded as a radio
imbecile, they are not allowed to direct enter frequencies, possibly
outside of their authorized band. The frequencies on their radios
are set by authorized technicians.

About the only way to avoid having seperate ham gear is to get an
authorized technician to put the ham freqs into your commercial gear.
I've seen this done on a number of radios. The best compromise is
to use the ICOM U16/H16 radios which can be programmed without any
special equipment, which would allow you to pretend you are the
authorized technician to set the frequencies. The other trick is that
this only became an issue because even in commercial gear they now
use synthesizers even though the radio gives the appearance of being
a single channel radio. I've seen older type-accepeted commercial
gear with synthesizers that predate the new guidelines.

I've never seen a dual band commercial radio.

I'm fairly sure that Yaseu makes a dual band commercial handheld which will work in the ham bands. I'm not positive on this, though. Icom makes great commercial radios which work great in both commercial and amateur bands, but they don't make a dual band unit. :-(

Yes, there is a station here in Tucson that broadcasts on Ch. 18, and
another low-power station used to hang out on Ch. 14, but has since gone
dark.

On a related note, how can one find out what frequencies a
particular organization uses if one is not a member of said group?
Obviously, one could scan and hope to find it by trial and error.
However, the FCC must have a list of these licensed frequencies
somewhere, to avoid problems such as assigning two nearby groups
the same freqs. So, the question is whether the frequency list is
publicly available and, if so, do libraries carry it? Heck, does
someone have it available online? (HOW MANY MEGABYTES ??!!?? :-)

Thanks.

1484. Software to Produce Great Circle Bearing Charts

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 01:22:09 UTC
From: pescatore_jt%ncsd.dnet@gte.COM
Message-ID: <9204271515.AA17896@bunny.gte.com>
Source record: 290608

Does anyone know of any software out there (commercial or shareware) to produce a great circle bearing chart given a particular lattitude/longitude?

Basically, I need to create antenna pointing maps for a number of lat/lons, in a graphical format on a PC or SUN or VAX or Mac. Postscript output is probably the best, TIFF or GIF probably usable as well. I definitely want graphical output, not a list of beam headings for various targets.

This is a work related project, so commercial or semi-expensive SW is ok. Any sources or hints will be appreciated.

thanks, John Pescatore WB2EKK

W2FG RETRANSMISSION FROM TG9VT APLINK MAILBOX

VP8SSI UPDATE

I WOULD LIKE TO TAKE [THIS] TIME TO THANK ALL OF THE DX OP'S WHO HELPED US TO MAKE THE SOUTH SANDWICH/SOUTH GEORGIA/FALKLAND ISLANDS DXPEDITION A GO.

60K QSO'S WERE MADE FROM ALL 3 ISLANDS. WE HAD HOPED FOR A LARGER NUMBER OF Q'S BUT DUE TO THE VERY BAD WX AND WIND CONDITIONS AND VERY SHORT BAND OPENINGS WE FEEL THAT THINGS [WENT] VERY WELL. AS FOR THE RUMORS OF LOSS OF EQUIPMENT [ETC.] I HAVE NO [IDEA] WHERE THIS CAME FROM WE DID HAVE ONE TUNER GO BAD DUE TO WATER BUT ALL THE EQUIPMENT OPERATED VERY WELL. AND ALL EQUIPMENT WAS REMOVED FROM THE ISLAND. WE DID LEAVE 2 ANT'S THAT HAD SEEN BETTER DAYS BUT THAT WAS IT.

I WOULD ALSO LIKE TO THANK THE CREW OF THE ABEL-J FOR GETTING US ON AND OFF THE ISLAND. CAPT. CARTER VP8CAY IS NOW A VERY ACTIVE HAM FROM THE SHIP. SO GIVE A LISTEN FOR HIM AS HE TRAVLES THE ANTARCTIC.

I HOPE WE WERE ABLE TO GIVE EVERYONE WHO TRYED TO CONTACT US A QSO. IF NOT WE ARE SORRY. IF YOU ARE COMING TO DAYTON STOP BY AND CHECK OUT THE VIDEO WE MADE AND THERE YOU WILL KNOW WHAT THE WORST PLACE ON THE FACE OF THE EARTH LOOKS AND SOUNDS LIKE IN SUMMER TIME HI ..

AGAIN THANKS TO ALL DE TONY WA4JQS/VP8BZL...SK

>
>On 8730, 8740 and 8770 I often hear "telephone" conversations in SSB.
>Could someone please explain to me what they are (ie. who do they serve etc.)

These are marine ship to shore radio telephone conversations. Typically
you will hear some merchant marine type talking to his wife, mom etc.

> On 8830 I receive airport information from three airports (Hong Kong, Hololulu and
Auckland). On 8870 I can pick up communications between planesand airports.

Typically the airports have HF links that are used to communicate long distance
with aircraft in their sectors. I frequently monitor Tokyo's Narita airport
on 6655khz. You will hear planes give their coordinates generally along
with other information. It is sort of neat to know where they are. I keep a
globe handy for the task.

>Also, on longwave (around 300-400 kHZ) I can pick up similaR AIRPORT INFORMATION (LOCAL).

Many local airports will have weather information available on low power
longwave for the use of pilots flying into and out of the airport etc.

1491. Re: Fancy Radios???

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 10:28:38 UTC
From: dstock@hpqmola.sqf.hp.com
Message-ID: <16610126@hpqmola.sqf.hp.com>
Source record: 290615

The manufacturer has a very different view to the customer of what the purpose of a radio is. If the radio sells and is not so obviously bad that it sets people against ever buying one of that brand again, then all the needs of the maker are satisfied.

Put youself in the position of the guy with a ham shop, or a stall at a rally. Someone comes along and asks to see the ITF 9001 HF rig, you let them play with it for a while, they then start to ask questions. All the questions fit into two groups;
Features/functions... How do I access the 100 memories, how many ways can I shift frequency information into and out of them? do the memories save the mode and filter and AGC and ... settings ? How would I connect a PK232 for packet AMTOR RTTY CW WEFAX SSTV ?
Comparisons.... Is it better than a XXXX or a YYYY or a ZZZZ. This is the real crunch, what on earth do "better" and "worse" mean ? The customer won't be at all specific about these terms, and a successful vendor knows not to ask. What the customer is asking about is the rig's reputation, can he proud, very proud, or extremely proud to show one in his shack?

We are now talking about the sales of consumer goods to people who, in the majority have only small knowledge of the functions of a radio. To get their licence they learned about the circuit diagrams of a number of simple circuits but not about phase noise and intermodulation. I would not criticise these people, I think that perhaps the subject matter is now sub-optimal for the modern radio amateur.

The shopkeeper can demonstrate the memories, the dual receiver(s) and all manner of wonderful controls and displays of a few competing rigs side by side. But how would he go about demonstrating receiver intermod and blocking levels, how many customers would stay, listen and understand if he could and did ?

Are dual, modest, receivers worse, equivalent, or better than one good one?

Will this rig just block up totally on field day ?

Are all the signals I can hear really there ?

Nice computer!!! is there a radio in there too??

>rmtnez@vm.ci.uv.es
Hopefully, Rafael, you have a full-size marine VHF with an 8-foot, boat-mounted whip, and the hand-held is a second radio. If not, I strongly (repeat - STRONGLY!!) recommend starting with those items first. Reason is that the hand-held with its rubber ducky antenna can only cover a couple of miles on the water whereas the VHF full-size rig and marine whip can cover lots more distance. Remember that when you need assistance, you wnat them to hear you. The hand helds were introduced into the marine fields primarily for port operations and docking, for which purpose they are ideal.

Horizon seems to be a well-respected name in marine electronics. ICOM is also excellent. I have the Ham Radio version of the ICOM marine handheld, and it is a beautiful rig. I think that either manufacturer's products should be reliable and well-backed for service.

>in the current generation of radios.)
>
>AL N1AL

How can you say this? The RF performance of most mid- and
high-end MF/HF ham radios of current manufacture is excellent.
The radios (Collins S lines, R-390/As, Heath SB-300/400s, etc)
usually invoked as embodying standard-of-comparision performance
are soundly beaten by most mid- and high-end radios in terms of

two-tone IMD receiver dynamic range (at the 20-kHz spacing used
in the ARRL Lab)

blocking receiver dynamic range

receiver minimum discernible signal

short- and long-term frequency stability

frequency calibration accuracy and resettability

AGC performance

frequency agility

frequency coverage

transmitter spectral purity

transmitter output-power control

features-per-dollar value when costs are adjusted for inflation
between "then" and "now"

and, no, composite (phase) noise in most mid- to high-end MF/HF
radios is not the problem it was some years back. (It's good
enough to let use measure receiver blocking dynamic ranges above
the high 130s, which means "it's generally fine to excellent."
Older radios may have cleaner LO chains, but their mixers usually
crunch sooner. Is death better by knife or blunt instrument?)

Transmitter IMD *may* be a horse race, depending on the rigs
compared, but this straw man is falling apart, too -- watch for
VMOS FETs in an MF/HF exciter very soon, and then you'll
routinely see transistorized-transmitter IMD performance that
easily beats 6146Bs equipped with RF negative feedback (as used

in the Collins KWM-2, for instance). Bipolars conservatively run at 28, or, especially, 50 volts, can already do this, and are doing so in some high-end ham transceivers.

Author info: I'm a student of ham history, political, social and technical. I've built, used, tested and (as appropriate) spectrum-analyzed many archetypal ham-radio receivers and transmitters extant between now and, say, 1930. I love regenerative receivers and 807s, I have an HRO, have owned an R-390A and still keep my 51J-3 warm. I've successfully and enjoyably used a UX-201A TNT on the air. I'm about to commission a 59 tri-tet (if the crystal will stay in its socket -- but my Bliley LD-2 and BC-3 should handle it if an FT-243 won't). (Fun, fun, *fun*.) But "things aren't like they were and the good old days, and they *never* were." You *can't* get better RF performance than today by going back in time.

|> Option #2: ACE AR1000
|> ACE AR3000

Have you considered the Radio Shack Pro-2006? This radio
is highly respected in the scanner community and in my
opinion, the best bang for the buck in terms of features,
performance and available mods (both scanner modification
books by Bill Cheek contain mostly Pro-2004/5/6 mods).
A good review of the Pro-2006 was written by Bob Parnass
who frequents this newgroup. I don't know if I am permitted
to include a copy of it here but Bob can be reached at
parnass@cbnewse.att.com. In summary, the Pro-2006 has
a lot of features, good performance and many modifications
if you want to add even more functionality.

FUN AND GAMES WITH KENWOODS LATEST DUAL BANDERS

UNDOCUMENTED FEATURES ON THE TM-741A and TM-732A

by Fred Lloyd, AA7BQ

Over the weekend, I took some time to experiment with my Kenwood mobile rigs and was quite surprised at what I found.

TM-741A

The 741 has three undocumented games built into it which are somewhat amusing. There is a "slot machine", a "space invaders" and a "musical keyboard".

To activate, press and hold the F and MUTE keys while turning on the power. The display will come up showing -1- -2- -3-
To activate game 1, press the Band 1 (leftmost) control, for game 2, press the Band 2 (middle) control, and for game 3, the Band 3 (rightmost) control.

Game 1 - "Slot Machine"

To start the wheels rolling, hit the MUTE key. The display shows "0 0 0" Then, press the Band 1, Band 2, and Band 3 keys in order to stop each of the wheels in turn. The radio emits a "phaser" sound when the wheels stop. I haven't hit the jackpot yet, so I don't know how it acts when the three numbers match... Use the VFO key to cancel the game and return the radio to normal operaton.

Game 2 - "Space Invaders"

Activate game 2 as shown above. The leftmost display will clear to all zeros. The center display is the "target". The rightmost display is some sort of shot counter. Manipulate the lower button row to play the game. The rig plays a tune when the game is over. Scores advance (with the phaser sound) as the game progresses. I don't know much more about it and don't exactly know the object of the game but I'm sure that someone will figure it out. Again, the VFO key cancels the game mode.

Game 3 - "Musical Keyboard"

Activate game 3 as shown above. The display says "Enjoy Sound Play". Each of the keyboard controls now plays a distinct tone. The VFO key cancels the mode. There are apparently 15 different tones available.

It's also worth mentioning that the radio receivers continue to operate while game playing takes place. Presumably, one could idle away the time playing games while sitting by the radio and listening for important calls...

OTHER TM-741 UNDOCUMENTED FEATURES

DISPLAY TEST

Hold down F and MHZ while turning on power. This activates the display test mode where all segments and indicators are lit. Note the "ACC" indicator at the lower right. ACC is not defined in the manual, however I saw it come on once one night after I started the car with the radio turned on. The display lit up ACC and the UHF frequency display showed some sort of HEX code (a ROM checksum maybe?).

STRANGE TEST

(WARNING: YOU MAY LOSE SOME SAVED MEMORY DATA)

Hold down the F and MR keys while turning on power. The radio plays a wild sequence of tones and the displays go all crazy for several seconds. When it's done, everything seems normal except that the memory contents are reshuffled and some memories are duplicated. I can only speculate that this might be some sort of factory memory test...

UNDOCUMENTED TM-732A FEATURES

CLONE MODE

Hold down the F and MHZ keys while turning on power. The current control band will display CLonE. Pressing CALL initiates the data transfer, graphically illustrated by a moving S-METER display. No RF is transmitted during data transfer, instead it is assumed that the data is dumped out of the microphone port. Nothing more is known about this at this time.

AM DETECTOR CONTROL

The AM Detctor, which automatically comes on below 136 MHz, can be forced ON at any VHF frequency by pressing the F and MUTE keys while applying power. Radio continues to transmit FM but receives AM. Changing frequencies or memory channels will cancel the forced AM mode. This capability could be useful for listening to the USAF Thunderbirds which sometimes operate in the 143 MHZ band using AM.

Well, that's it for now. Please let us know if you can discover any of the other undocumented features available on the new rigs.

>either right before or right after the 9 Mhz filters. There is very little
>space inside and I am wondering whether extra strays would not compromise the
>rx? What is your opinion and have you heard of anybody modifying the 735?

If this becomes an email thread, I'd REALLY like to be kept informed
on what happens, as I too have a 735 and would be interested in any
mods to improve it. (Not that I think there is anything WRONG
with it right now, mind you :-), but I did feel that the SB102 that
was replaced by the 735 was a little more sensitive...)

>Ignacy Misztal NO9E, SP8FWB E-mail: ignacy@uiuc.edu
>University of Illinois Phone: (217) 244-3164

(Editorial changes, mostly for brevity, were made to the included
text. Any errors introduced thereby were accidental and not intended
to cast a bad light on the original posters, or (for that matter),
this poster :-)

As I pause before posting this (everybody pauses before posting, don't
they? Emily Postnews says we should, and I want to be politically
correct in SOMETHING, anyway :-) :-) :-), it strikes me that having a
more sensitive radio may at times cause me to be more frustrated than
I currently am (which is not very). I remember times back with the 102
when I would hear folks 50 (my meter rarely moved - Super stingy S-meter
on 102's I hear), and I would reply to their call only to hear them
continue merrily on their way calling "CQ", obviously never having
heard me. Pretty frustrating.

I've had a few times on the 735 when I heard someone calling cq
who was a definate 5-7 to 5-9, who never skipped a beat after I
replied - just kept on calling cq. And since I *generally* recieve
a better signal report (by 2 s-units) than I give out... It makes
me wonder if their radios are working :-).

But if EVERYBODY had mods in their HF rigs for better sensitivity...
Hmm.

On the other hand, for most of last week the problem seemed
to be noise, not signal strength - so I'm not sure such a mod would
even be useful...

Enlightened opinions gratefully accepted :-)

Hello Bob,

Thanks for your recent postings on the DSP based TNC. Very interesting! I wanted to buy one about a year ago and it was not quite ready (That is what
AEA told me anyway...) In anycase, it seems that I need to start saving my pennies for one now!

When I called AEA about a year ago, they were not sure if a developers package would be available, but they did tell me that I was "welcome to purchase the
tools from Motorola directly" At the time I seem to remember the software tools costing about as much as the AEA-1232!

Do you have a feeling of how much the "experimenter's kit" will cost (a rough estimate is fine) ?

The obvious supply / demand curve applies here. If the tools are expensive, then few will develop additional software MODEMs for the DSP 1232/2232. If the tools are cheap then many will purchase and more people will develop additional software MODEMs.

Thanks for your effort on this great project. I hope to find time in the next year for working with the DSP 2232, now that some of my other projects are wrapping up (two 1.2 GHz repeaters, 1.2 GHz packet cluster node, and the chapter I wrote for the new RFI book is complete, etc. Whew... I need more spare time :-)

Have a great week!

1514. Charging nicads from car cigarette lighter.

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 18:39:24 UTC
From: cvm@nauvax.ucc.nau.edu
Message-ID: <27APR92.18392469@nauvax.ucc.nau.edu>
Source record: 290538

I would like to be able to charge the battery pack on my HT from my car cigarette lighter. It seems to me that this would be quite simple. All I think I have to do is connect the cigarette lighter adapter plug to the correct connector for my battery pack while maintaining a proper polarity and putting a resistor in series to restrict the current flow to the correct amperage.

My battery pack is 7.2 volts and 600 mah. The charger for it puts out 10.4 volts and 42 milli-amps. So assuming the battery pack is fully discharged (0 volts) and that the car is supplying 13.8 volts then I would calculate the resistor size to be:

(13.8 - 0) volts / .042 amps = approximately 328 ohms

When the battery pack is fully charged (7.2 volts) it would still be drawing 20 milli-amps. Calculated by:

(13.8 - 7.3) volts / 328 ohms = .02 amps

A one watt resistor should be large enough. (13.8 volts * .042 amps = .5796 watts)

Is this all there is to it? It seems too simple. Should I consider dropping the voltage from 13.8 volts to reduce the current when the pack is fully charged and thus prevent overcharging of the battery pack? Or increasing the resistor size for the same reason? This would increase the charge time. Does it matter which side of the battery I put the resistor on?

Date: 1992-04-27 19:26:34 UTC
From: CELLIS%BROCKVMA.BITNET@cunyvm.cuny.edu
Message-ID: <9204271925.AA24868@ucsd.edu>
Source record: 290539

Well, a new one on me. I just had a friend ask...
"I heard something about a command or something that would allow the
preamp in the Icom W2A hand-held to turn on" - somehow giving the impression
that the poor sensitivity in the 220 Mhz range was due to the receiver
preamp not being switched in. Has anybody else heard of this (or maybe
a converse item - such as the attenuator that is switched IN on a TS-440S
when you are in the 500 to 1500 Khz range?). BTW, the attenuator dis-abling
in the 440S works. I can now hear NAVTEX at 518 Khz and WLS at 650 Khz here
in Rochester, NY. Couldn't copy either before. WLS isnt loud but it's there.
Now if the 440S would only Transmit in the 500 Khz to 1500 Khz range like its
predacessor the TS-430S......but then why would anybody want to jepordize their
liscense (but into a dummy load it made a good test signal generator).

Before I answer your questions, a basic tip: don't do this. A transmitter of this power is illegal without a proper license, and it will be real easy to track down; and to be frank, without a good deal more skill in electronics, the result is likely to be so much interference that there will be no shortage of motivated people looking. If you want to build a ham rig, study enough electronics to know what you're doing, and get a license -- it only requires a fairly simple test of radio theory and regulations (the 50MHz and up Technician license no longer requires a Morse code test).

Now, on to the electronics questions.

First, I would recommend getting a good text on electronics and learning this stuff in detail; lots of people recommend "The Art of Electronics", by Paul Horowitz and Winfield Hill (ISBN 0-521-37095-7, Cambridge University Press). It's real expensive, so you might want to see if it is at the library at your school (assuming you attend the UW and aren't just posting from there).

>1: some one recently told me that the ratio of my frequency/inductance/capacit-
> -ance was (with 2pieF = w) w = 1
> -----
> -----
> \/ LC
> They were able to explain partialy how that works but I still don't
> know does this alwas work? If so are there other formula to guide by.

That is *the* formula for a resonant inductor/capacitor combination. The only times it doesn't "work" is when different principles are used to determine the resonant frequency of something (as in VHF circuits where there aren't any discrete, separate inductors and capacitors).

> mostly what I am looking for is the equasions that give the part values
> that inturn give the frequency. I am sorry that thesr are rather stupi
> proiablems but I am a little confused. (and rapidly getting more so)

Clearer writing would help. Do you mean "what part values do I use for a given frequency?" This depends on the circuit, because there's an infinite number of inductance/capacitance pairs for each frequency. Basically, you pick a value of reactance (the AC equivalent to resistance) which is appropriate for the circuit; the reactance of the inductor and capacitor are equal in magnitude at resonance (and of opposite sign), and that magnitude should be quite a bit lower than any parallel resistance in a tank circuit, to ensure that the "Q" (quality factor, defined (for a parallel circuit) as the resistance divided by the reactance (in ohms) of either the inductor or capacitor) is high enough to provide a sharp resonance.

>2: I think that the above equasion will give me the alterations nesicary to
> change the inductor from a icoil of six wires to a ferrite rod/lopstick
> .. will that then give me the new capacitence? Will I have to alter the
> values of any other parts as a result.. I suspect so but HOW do I
> determin there new values..

To change the RF frequency of this circuit, you would need to calculate the reactance of the elements of the tuned circuit (the variable capacitor and the inductor) and the feedback capacitor (C6 plus the base-to-emitter capacitance of the transistor) and find components giving the same reactances at the desired frequency.

>3: I *think* that to put my amplifier in to this circit I would replace Q2
> with my amp or amp chip...

No. Q2 is being used as an oscillator, and (in general) the more power you try to draw from an oscillator, the poorer quality the signal will be (due to component heating and other effects), and this circuit is already bad enough. It would be better to feed the amplifier's input from the output of the oscillator (the antenna tap, fed to a .1uF capacitor to block the DC, into the amplifier). However, this circuit really doesn't lend itself to adding an amplifier, anyway; its chief virtues are that it is simple enough to be built by Radio Electronics subscribers and low power enough to be legal.

>4: This is the realy stupid one so brace yourselves.
> I still dont realy understand the total inner workings of a tanked
> oscilator. I think I see how C7 would create the carier frequency with

> Q1 but as I understand it the whole transmiter is driven by the
> changing voltages acrost R1, R2, R4,and R7. How does this drive the
> mic. I just see the current as running straight to the ground here?

First, ignore C7, it has nothing to do with the carrier frequency; its purpose is to ensure that the +9V power supply terminal is at RF ground. Second, why do you think the current runs straight to ground? Through what path?

Next, I think I need to establish how the circuit *works*: If you cut the circuit horizontally (as you drew it) just below R6, you have two separate functional units, an audio amplifier, and an RF oscillator. I will describe how the audio amplifier works first.

The mic is supplied current from the 9V supply through the 1K resistor (R1); I assume the mic is supposed to be a carbon microphone, which acts as a variable resistor, therefore there will be a variable voltage at the junction of the microphone, R1, and C1 (the mic and R1 act as a voltage divider whose ratio (hence the voltage) change according to the sound pressure). This variable voltage passes through C1 (it varies at an audio rate, hence C1 (10uF) offers little impedance) to the base of Q1. Describing the biasing of Q1 requires more detail than I feel like going into right now; suffice it to say that this is a common-emitter amplifier set up to act as a voltage amplifier with a gain of 2 (roughly).

The oscillator stage is a Hartley oscillator; it is a grounded base amplifier with a tuned circuit acting as a load (which will be a high impedance at its resonant frequency, and a low impedance at all other frequencies), and the feedback is C6 plus the built-in capacitance(s) of the transistor (chiefly the collector-to-emitter capacitance (Cce)). The transistor receives its operating (DC) current through the inductor.

The frequency of the tuned circuit is determined by the inductance and the total capacitance in parallel with it: the variable capacitor, in parallel with C6, in parallel with Cce. (The reason that C6 and Cce are in parallel with that variable capacitor and not in series is C7 -- as I said, it ensures that at RF frequencies, the DC supply (and thus the top end of the tank) is connected to ground.)

When the audio amp is connected to the oscillator, something "magic" happens: the variable (audio) voltage changes the DC voltage at the base of Q2, which changes the base current -- and it turns out that Cce is dependant upon the base current. Therefore, a change in base current changes (slightly) the resonant frequency of the tank circuit -- frequency modulation.

[Thinking about it, I'm a bit suspicious of this explanation; I think it's basically correct, but there's some detail in it that's probably out of place.]

>5: If I do build a small transmitter like this one would a regular audio amp
> be able to increase my signal strength? If so what is the ratio, or is
> there a equasion to determine it (would a 15 wat audio amp give me
> a 15 wat signal?)??...

No. See above. The audio signal is used to set a frequency, not to power anything. In an AM transmitter, the audio power adds to the RF power (but cannot exceed the RF power of the carrier).
>
>6: Lastly can I convert the schematics I have been reading for short wave
> amplifiers to these FM bands..???

Probably not (I assume you mean the 88-108 FM broadcast band). The circuits might work, after properly scaling the inductors and capacitors, but the FM band is just high enough in frequency that some of the assumptions made in shortwave circuits don't work -- inductors really have some stray capacitance, capacitors really have some stray inductance, and every other part has plenty of both types of strays. If you know what you are doing, it isn't hard to make an amplifier for FM, but in this case that seems to be a stumbling block.

Lastly, a (repeated) comment about the circuit you gave. It is a toy, suitable for building out of uncritical parts for uncritical uses where you're not going to interfere with anything outside of the room it's in. It isn't a suitable starting point for a higher powered transmitter (and wasn't the best of circuits even for its application); and any higher power level will require some kind of license.

I hope this helps. You probably would benefit more from a course in electronics; the Seattle area certainly has no shortage of amateur radio clubs giving courses, and there's probably even one at UW.

1521. Re: Kenwood HT77A question

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 20:41:56 UTC
From: rwb@borg.VI.RI.CMU.EDU
Message-ID: <1992Apr27.204156.83722@cs.cmu.edu>
Source record: 290545

The consensus was that only very early HT77's have the problem.

I ended up buying Kenwoods new version, the HT78A. It avoids the problem entirely by storing memories in an EEROM. An additional EEROM can be added to expand the memory to 250 channels. There is still a lithium battery, for backing up VFO's and other short term state.

A fantastic radio.

-Bob N3EMO

1522. Re: What's available for SSTV?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 20:43:05 UTC
From: johnl@avs.com
Message-ID: <9204272015.AA05898@aurora.Stardent.COM>
Source record: 290546

Here is a quick summary of what is available for SSTV and WEFAX. There
are surely many omissions.

I'd like to expand this with locations of public domain software and
a more complete bibliography of magazine articles.

Please send additions and corrections to johnl@avs.com and I'll
distribute a new version occasionally.

I'd also like to know where you found this so updates can be sent
to the appropriate places.

de John Langner WB2OSZ, 4/16/92

Scan Converters

A couple years ago anyone who was serious about SSTV had a Robot 1200C.

It is a complete system dedicated to SSTV. Just connect it to
- Color TV camera (either NTSC or PAL).
- Color TV set or monitor.
- Speaker and Mic connectors of a transceiver.
- Tape recorder for picture storage.

It has 4 black & white modes (one compatible with original 8 second) and
4 color modes with different transmission times and resolutions.

It displays images with 256 x 240 resolution with 18 bits per pixel.
That's more than 250,000 colors.

Robot Research
5636 Ruffin Road
San Diego, CA 61927

It also has a parallel port for connection to a home computer. Several
different programs for transferring images to/from the 1200C and for
performing various other functions are available.

Hi-Res, Version 1.4 (for IBM PC)
Tom Jenkins N9AMR
5968 S. Keystone Ave.
Indianapolis, IN 46227

SCAN, Version 6.0 (for IBM PC)
Bert Beyt W5ZR
301 Tampico St.
New Iberia, LA 70560

SSTV (for IBM PC)
Garnet Bebermeyer WB0UNB
15 Almeda Ct.
Fenton, MO 63026

IMAGE (for IBM PC)
Dick Isely WD9GIG
736 Fellow St.
St. Charles, IL 60174

name? (for Amiga)
Tom Hibben (call?)
Box 188
DeSoto, WI 54624

Replacement PROMs are available to give the 1200C other transmission modes such as Wraase, Martin, Scottie, and AVT. PROMs available from:

Martin Emmerson G3OQD
6 Mount Hurst Rd.
Hayes, Bromley
Kent, England

Unfortunately Robot Research is more interested in selling higher priced systems to industrial customers. The 1200C hasn't been enhanced or advertised for years. There are conflicting reports as to whether the 1200C has been discontinued entirely or if an occasional batch is manufactured.

Two clones of the 1200C are available:

LM9000
John Wilson VK3LM
R.M.B. 4201A
Tallangatta Valley 3701
Victoria Australia

NS-88
Munaki Yamafuzi JF3GOH
P.O. Box 670
Osaka Japan 531

I think the LM9000 is available only as blank PC boards. One magazine article warned readers not to be too hasty about purchasing boards because the other parts required are hard to find and more expensive than you would expect. But if you do build one it is compatible with the 1200C and can use the Martin Emmerson PROMs.

The only other stand-alone scan converter mentioned during the last few years is the Wraase SC-2. Not much was mentioned about it.

Volker Wraase Electronic
Kronsberg 10
D-2300 Altenholz
Germany

Home Computers

Now that most home computers have plenty of memory and acceptable color graphics, the most cost effective method is to use a computer with a suitable interface and software.

Note that if you want to send a picture of anything real, you will also need a frame grabber which will add a few hundred more $ to the total system cost.

Amiga

The AVT system has become quite popular during the last couple years for both SSTV and WEFAX. It is composed of an interface that attaches to the parallel port and software.

It has images with up to 4096 colors, all the popular transmission modes, builtin graphics editor, text generation, image processing techniques to clean up noisy pictures, and loads of other features.

AVT Master
AEA
P.O. Box C2160
2006 196th St. S.W.
Lynnwood, WA 98036-0918

Atari ST

Color SSTV, WEFAX, and other ham radio software are available from these user group program libraries:

Atari Microcomputer Network
John Adams KC5FW
17106 Happy Hollow
San Antonio, TX 78232

ASTUR (Atari ST Users on Radio)
GEERAERT Michel
W. Elsschotlann 21
B-8460 Koksijde
Belgium

The WEFAX program requires a very simple interface containing an XR-2211.

The "sSTv" program can use two different interfaces.
In the low cost configuration, the internal sound generator is used for transmit and a simple two chip interface (total cost about $7 including perf board, connectors, etc.) is used for receive.

Much better results can be obtained with an interface from:

A&A Engineering
2521 W. LaPalma, Unit K

Anaheim CA 92801
(714) 952-2114

See 73 Magazine, December 89 and January 90, for more details.

The latest version of the software has all the popular modes (Robot, Wraase, Martin, Scottie, AVT), a graphical user interface, and full screen images with dithering to give the appearance of hundreds of colors when viewed from a distance.

IBM PC

Several WEFAX systems are available:

PC HF Facsimilie 4.0
PC GOES/WEFAX
Software Systems Consulting
150 Avenida Cabrillo, "C"
San Clemente, CA 92672

MULTIFAX
Schwittek WEFAX Systems
David E. Schittek NW2T
1659 Waterford Road
Walworth, NY 14568

AEA-FAX
AEA (address above)

A & A Engineering
(address above)

There are surely others. I found these by flipping through a couple recent magazines. My main interest is SSTV so I'm not familiar with the features of WEFAX systems.

A several months ago, I started this paragraph with "The SSTV picture is dimmer" because there were no viable systems available.
Software Systems Consulting (above) has an interface and software for SSTV but it is only black & white. Today everyone uses color so it would be foolish to spend a significant amount on a B&W system.

The situation has changed rapidly. There are now two substantial systems with rumors of two more on the way.

Viewport VGA (developed by KA2PYJ)
A & A Engineering
(address above)

Pasokon TV
John Langner WB2OSZ
115 Stedman St. #F
Chelmsford, MA 01824-1823

(please send SASE for details)

Both systems above require a VGA. Feature lists will probably be outdated by the time you see this so write to the addresses listed for fresh information.

Others

There have been SSTV implementations for other machines such as the Radio Shack COCO and the old 8 bit Ataris. (See Bibliography, below.) CQ-TV also mentions SSTV for machines we never heard of in the US.

Publications

Modern information on SSTV is very scarce. The last SSTV handbook, that I know about, was written by Don Miller W9NTP and Ralph Taggart WB8DQT about 15 years ago.

The British Amateur Television Club has a book, The Slow Scan Companion ???, but it's not really a handbook with organized chapters on different topics. It's more like a random collection of magazine articles. It is missing very fundamental information such as how color images are conveyed by audio tones.

There are a few magazines that specialize in Amateur Television. These are mostly oriented toward fast scan TV but SSTV and WEFAX are mentioned occasionally.

(Regular column on 'Satellites, Facsimile & Slow-Scan TV Imaging' by Fred Sharp W8ASF)
The SPEC-COM Journal
P.O. Box 1002
Dubuque, IA 52004-1002

(Frequent column 'SSTV Revisited' by Roland Humphries G4UKL)
CQ-TV
British Amateur Television Club
Dave Lawton G0ANO
Greenhurst, Pinewood Road
High Wycombe, Bucks HP12 4DD
England

Amateur Television Quarterly
1545 Lee St.
Suite 73
Des Plaines, IL 60018

Booklets of old ATVQ and A5 articles are available from:

ESF Copy Service
4011 Clearview Dr.
Cedar Falls, IA 50613

Bibliography

It will take some time to track down more old articles for this section. But it won't take long to type them in because there aren't many!

I've purposely excluded the scores of articles describing modifications to the Robot 400 because they're all in the booklets from ESF and of little interest to someone without a Robot 400.

Abrams, Clay K6AEP & Taggart, Ralph WB8DQT, "Color Computer SSTV", 73, Nov-Dec 84.

Goodman, Dick WA3USG, "SSTV with the Robot 1200C Scan Converter and the Martin Emmerson EPROM Version 4.0", 73 Amateur Radio Today, Jul 91, p. 46.

Langner, John WB2OSZ, "Color SSTV for the Atari ST", 73 Amateur Radio, Dec 89, p. 38, Jan 90, p. 41.

Langner, John WB2OSZ, "SSTV - The AVT System Secrets Revealed", CQ-TV 149 (Feb 90), p. 79.

Schick, Martin K. KA4IWG, "Color SSTV and the Atari Computer", QST, Aug 85.

Summary

Most people are scared away from trying SSTV because they think it HAS TO be expensive. That WAS true but it's not anymore. With 3 or 4 new color SSTV systems for use with the IBM PC, 1992 will be the year that SSTV really takes off.

1523. Fluke 97 Scopemeter, any comments on them?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 20:58:18 UTC
From: roberts@ishtar.med.jhu.edu
Message-ID: <1992Apr27.205818.29446@boingo.med.jhu.edu>
Source record: 290547

Hello,

I have been looking into the possiblilty of getting one of Fluke's new Scopemeters. These are their new portable digital multimeter/digital storage scope combos. They look very nice, and I'm sure they are of very high quality (being Fluke). The price also seems reasonable, for what the things do.

If anyone has used one, or has seen one in use, I would like to hear their impressions. Does it work as well as the ads describe? What aren't they telling us. Is the scope display updated quickly (quickly enough that it looks like a real scope, and not a computer drawing a picture)? What limitations have you run into? What doesn't it do that you think it should do?

Thanks for any info,

dale, roberts@ishtar.med.jhu.edu

Slowly but surely every one on the lamps on the front of my DR110 has needed to be replaced. Including the Freq display :-(Has anyone had similiar experiences? Not that bad a problem, just a pain. I do move the unit frequently between house and mobile. I guess thats why they have the model with the backlit LCD.

Marty

What about an old fashioned horse race here? As more and more people (like me, for example) develop a renewed interest in the older equipment, the question of whether the old stuff is really as good as we claim/pretend it is will come up again and again.

Suppose the ARRL were to take the best of the best from the past and do a heads up comparison of it to a modern rig. With cold facts and numbers side by side, the question would be answered once and for all. Such a comparison would make interesting QST reading, I believe.

So what's the best of the best? Well for one thing it can certainly be an endless debate about personal favorites. I'll suggest mine right away: For Receivers....Compare a Drake R-8 to a Drake R-4 or perhaps a 2B/C.....this ought to be good for as close to an apples to apples comparison as you can get. For apples and crabapples, there are plenty of other competent vintage receivers to chose from such as the hallicrafters SX-115, Collins S-line receivers, and units from Hammarlund and National.

For Transceivers, the venerable KWM-2 and TR-4 come to mind in a comparison to any modern transceiver. I'm sure there are other transceivers that are personal favorites that are worth of mention but I'll leave it to someone else to name them.

Bottom line, though, I'd personally like to see how some of these old units, units that I and probably others lusted after when we were penniless teens, stack up against today's silicon-based gear.

Before the Federal Communications Commission
Washington DC 20554

In the Matter of Roberto Pazano, Tampa Florida, April 24

1. This is a Notice of Apparent Liability for Monetary Forfeiture issued pursuant to Section 503(b) of the Communications Act of 1934, as amended, 47 USC 503(b) to Roberto Pizano for willful violation of Section 301 of the Communications Act, 47 USC #301. On November 18, 1991, Mr. Pizano operated an unlicensed station on 7080.8 kHz.

2. The appropriate amount of forfeiture for this violation is $8,000.

3. The Commission became aware of the operation of an unlicensed station through a publication for shortwave listeners. Upon receiving a complaint from an amateur about this unlicensed station in the 40 meter amateur band, the Commission's Field Operations Bureau (FOB) located the source of the transmissions as RA Auto Wholesale, 3912 1/2 West South Avenue, Tampa, Florida. The owner of the establishment informed FOB that the knew nothing of the radio operation and that he only furnished the space to Mr. Pizano's organization.

4. The schedule of Mr. Pizano's operation was given over the air and he used his name on the air. Mr. Pizano was interviewed by FOB staff and took full responsibility for the unlicensed operation.

5. The nature of the transmissions was anti-Castro propaganda. Mr. Pizano spoke as president of "Federacion Mundial de Ex-Presos Politicos Cubanos." It was alleged that Mr. Pizano is a former political prisoner who spent 18 years in a Cuban prison.

6. Mr. Pizano has clearly violated Section 301 of the Communications Act.

7. The violation on November 18 1991 is clearly willful.

8. Pursuant to our Polity Statement, Standards for Assessing Forfeitures, the base forfeiture amount is $8,000 for operation without an instrument of authorization.

9. Accordingly it is ORDERED, pursuant to Section 503 (b) of the Communications Act of 1934, as amended, 47 USC 503 (b) and Section 1.80 of the Commission's Rules that Robert Pizano is APPARENTLY LIABLE FOR A MONETARY FORFEITURE, in the amount of $,000 for operating an unlicensed station in violation of Section 301 of the Communications Act.

1527. Volunteer Examiners lose licenses

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 21:33:15 UTC
From: lhurder%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <597@arrlhq.UUCP>
Source record: 290551

Before the Federal Communications Commission
Washington DC 20554 - Released April 24, 1992

In the matter of Revocation of License of Sandra V. Crane, Amateur Radio Station N6TFO and Suspension of License of Sandra V. Crane Amateur Extra Class Radio Operator License and Revocation of License of Charles Pl Pascal, Amateur Radio Station WB6CIY, and Suspension of License of Charles P. Pascal, Amateur Extra Class Radio Operator License.

1. It appears that the respondents, Sandra V. Crane and Charles P. Pascal, were the operators of the California Amateur Radio School in Los Angeles, California, at all times pertinent to this proceeding. Further it appears that Pascal, Crane, or both gave instruction to students of the school prior to the administration on August 4, August 24, and September 14, 1991, of amateur service license examinations. Last, it appears that the respondents, prior to the administration of the examinations, had information that they used to tailor the content of their instruction at the school to include answers to all or most of the questions that would later be part of the examinations, while excluding from instruction the answers to most questions that would not be part of the examinations. This last-described action by respondents constitutes an apparent willful and repeated violation of Section 97.17(e) of the Commission's rules, 47 CFR 97.17 (e).

2. Additionally it appears that Crane willfully and repeatedly violated Section 97.17(e) as well as Sections 97.515 (d) and 97.517 of the Commission's Rules, by administering amateur service license examinations to her daughter, Tracy L Gullotti, on November 12, 1990, january 6, 1991, and april 12, 1991. It also appears that Pascal, by coadministering the November 12, 1990, examination, also willfully violated Sections 97.17 (e) and 97.514.

3. In light of Crane's and Pascal's apparent violations of the Commission's Rules, we propose to revoke their amateur service station licenses and are suspending their operator licenses...

4. Crane and Pascal ARE ORDERED ... TO SHOW CAUSE why
the captioned amateur service radio station licenses
should not be revoked...

5. Additionally, Crane's and pascal's captioned operator
licenses ARE SUSPENDED under Section 303 (m) (1) (A) of
the Communications Act... for the remainder of the
license terms....

1528. Another CB'er bites the dust

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 21:34:19 UTC
From: lhurder%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <598@arrlhq.UUCP>
Source record: 290552

Before the Federal Communications Commission, Washington DC 20554 -
- released April 24, 1992.

1. This is a Notice of Apparent Liability for Monetary Forfeiture issued pursuant to Section 503(b) of the Communications Act of 1934, as amended, 47 USC #503(b) to David Plourde for willful violation of Section 301 of the Communications Act, 47 USC #301. On October 9, 1991, Mr. Plourde operated a CB Radio Station on 27.214 MHz using a non-type -accepted transmitter and a linear amplifier. Use of non-type-accepted transmitting apparatus voided Mr. Plourde's authorization to operate CB station, 47 CFR #95.404 and 95.409.

2. The appropriate amount of forfeiture for this violation is $10,000.

3. On October 9, 1991, in response to complaints of interference, the Commission's Field Operations Bureau (FOB) monitored transmissions from Mr. Plourde's station on 27.215 MHz from 5:18 PM to 5:30 PM EST. After they had monitored the station the FOB inspected it and determined from equipment configuration and the admission of Mr. Plourde that he had operated a Kenwood TS-940SD 200 watt hf Amateur type transceiver. A Dentron 160-10L hf linear power amplifier was attached to the transceiver. Both the transmitter and linear amplifier are not type-accepted for use in the CB Service.

4. Mr. Plourde has been the subject of complaints of 12 persons in four cases handled by the FOB since moving to his present address. There is a history of complaints concerning Mr. Plourde's CB operation at his previous address. Mr. Plourde has not been cooperative in addressing these complaints.

5. Mr. Plourde has clearly violated Section 301 of the Communications Act. Section 95.404 of the Commission Rules, enacted pursuant to Section 307 (e) o the Communications Act specifies that an individual license is not required to operate a CB station. Section 95.404(a) of the rules specifies, however, that "Use of a transmitter which is not FCC type-accepted voids your authority to operate the station".

6. The violation in October 9, 1991, is clearly willful.

7. Pursuant to our Policy Statement, Standards for Assessing Forfeitures ... the base forfeiture amount would be $8,000.

8. Pursuant to the Policy Statement, it is appropriate to increase the amount of forfeiture when the conduct is intentional. In light of the history of complaints, it appears that Mr. Plourde's violation was intentional. We, therefore, increase the amount to $10,000.

Well, it uses and LCD display, so regardless of sampling speed it doesn't
look like a crt scope. Fluke had a display here at Intel and the 97 looked
pretty good to me.

>picture)? What limitations have you run into? What doesn't it do that
>you think it should do?

I can think of one possible draw-back to the 97: I'd be pretty cautious
about using the DMM portion of a near-$2000 DMM/scope combo like this in any
high-voltage/high-current aplication. I suspect the DMM and scope share some
or all of the same processor, so any fatal over-voltage to the DMM could
take out the scope too. I've learned the hard way that fuses don't always
save you from your own negligence. Thus, I'd likely use the 97 primarily for
the scope, and in that case I'd be better off with a separate scope and DMM.
It may be that the 97 is rugged enough to handle massive over-voltage, but
I'd hate to find out differently.
David Covell (who destroyed a $200 Phillips with 1400 VDC and learned the
hard way that some meter manufacturers won't sell you replacement processors).

1530. IsoLoop questions and comments

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 21:54:51 UTC
From: plumer@boreas.Stanford.EDU
Message-ID: <1992Apr27.215451.5541@EE.Stanford.EDU>
Source record: 290554

Does anybody have any experience with the
AEA 10-30 IsoLoop? I am working on a
2nd floor balcony installation of the loop
and have been having a few problems.

Specifically, I was wondering:

* How noisy should the receive be
with this antenna?

* How critical is it to elevate the antenna
away from the surface of the balcony.
Extending very high makes it much more
visible. With neighborhood antenna
restrictions ... well, you know the rest.

* on both of the above points, is horizontal
or vertical polarization better?

* How critical is good grounding of the rig
with this antenna. A good earth-ground
is a problem here.

Here are some of the points that I have found
so far.

* The antenna is solidly built and very easy
to mount.

* I had problems with SWR when feeding it with
RG-8, however, converting to RG-8/U seems
to have cleared that up.

* The ergonomics of the LC-2 loop controller
(the box that remotely controls the antenna
stepper motor) leaves a lot to be desired.
It is very cheaply built, the Left/Right
buttons are horrible, nothing like what the
ad shows, and the LED signal-level meter is
much harder to use than the rigs S-meter.

* No need to clip wire lengths or adjust
element lengths to tune it when installing
... no, you get to re-tune it every day!

* On the other hand, re-tuning the antenna
across the bands is not as bad as I thought
it would be.

After a bit of practice, peaking the RX
signal becomes second nature.

tnx es 73 de KM6IQ, Edward

please reply to "plumer@boreas.stanford.edu"
I will post any interesting results.

1531. Re: getting at "read" articles, PK-232 Mod

>In article <940@shrike.com> kriss@austin.lockheed.com (R M Kriss) writes:
>>Help! I just read a posting about a FB PK-232 Modification. When I tried
>>to save it, I screwed up and lost the article and marked it as read and
>>could not find it again.

What I've done when faced with such a problem is to get out of rn, then
edit my .newsrc file. Do a "vi .newsrc" then do
a "/rec.radio.amateur.misc" to find that character string. It puts
the curser at that location in the file. Then to the right are some
numbers representing what range of article numbers you have read or marked
as read. Edit the number on the right to a smaller value to make rn
think you haven't read this newsgroup for a while, and havent read anything
since the article of the new number you created. Now do a :wq and then
get into rn. If you (and I) haven't goofed it up, rn will let you see
the old articles you really did read, but it now thinks you haven't after
doing surgeery on the .newsrc file

C1 0 0 0 1 136-174 340-512 5.7/10 China Model

0 = Resistor IN 1 = Resistor OUT

Notes:

1. All "resistors" O ohms (wire jumper OK)
2. Green wire is equivalent to R22 - present in K1 model
3. 0 = resistor present, 1 = resistor absent
4. Standard shifts in MHz VHF/UHF. Those listed as (1.6) also do -7.6
5. Codes not listed are used in Japan version, special CPU required
6. M column is factory MODE number
7. K2 Mod includes 410-770 RECEIVE and enables CLONING features

To perform any of these mods, remove the back cover from the remote
head unit. Resistor numbers clearly marked on board along top.

800 MHZ RECEIVE

To enable 800 receive, switch to UHF VFO (not available in UxU),
press and hold MHZ button until 800.000 appears.

A capacitor must be added (C348) to enable the 800 receiver.
To add, remove UHF transciever board and next to the pad of pin 1
of IC-202 (on the foil side), add a 2.2 pF chip capacitor.
A wire can be used instead of the capacitor but sensitivity will
be reduced. (See schematic diagram for reason).

HARD-WIRE CLONING (Works in all confguration modes)

This procedure allows you to clone the entire memory of a "master"
transciever into the memory of a "slave" transciever.

First, construct an RJ-45 Jumper cable as follows:

```
------| |------
UP ---------------------------- UP Note that PTT and DOWN
E ----------------------------- E are crossed end-to-end
PTT ---------------------------- DOWN
DOWN --------------------------- PTT
------| |------
```

For hacker's reference: UP=CLK, PTT=SO/, DOWN=SI

1. Configure the master transciever's memories as desired.

2. Switch power OFF, hold down F and MHZ keys and switch
power back on while holding keys. Display will show "CLonE".

3. Set the slave transciever in the clone mode (as in step 2).

4. Plug the cable into the two radios (which end does not matter).

5. Press the CALL button on the master. When "End" is displayed,
operation is complete.

ON AIR CLONING (Does not work in K1 or E1 Mod modes)

This procedure allows you to clone a second transciever as above,
over the air. The data is transmitted automatically using DTMF
tones. During transmission (which is one-way only), the master
will automatically switch to LOW power. To be legal, use only a
UHF cloning frequency.

This procedure is not enabled in the stock transciever. At a
minimum, you must cut the green wire to make it work.

1. Configure master transciever's memories as desired. Select
a UHF simplex transmit frequency and set PTT to UHF (will work on
VHF but is not recommended).

2. Switch the power OFF. Press and hold the CALL and DTSS buttons
and turn the power back ON. "CLonE" appears in display.

3. Set the receive frequency on the slave transciever the same
as that of the master. Turn power OFF, hold down CALL and DTSS
keys and turn power ON. "CLonE" appears in display.

4. Press the PTT on the master's microphone. Data transmission
will begin. In case of a receive error, the slave transciever will
display "Err". When the procedure is complete, both radios will
display "End".

THE FOLLOWING FEATURES ARE UNVERIFIED, SO
YOU MAY NEED TO EXPERIMENT FOR YOURSELF

PAGING ANSWERBACK (Does not work in K1 or E1 Mod modes)

The exact operation of this feature is unclear but the following
description has been given:

1. To enable, hold down the F key and press the TONE key.

2. Do disable, repeat step 1

When enabled, documentation says: "If a matching code is received and the other transciever is no longer BUSY, the code of the local transciever is sent to the other transciever. The answerback function then turns off."

MEMORY RECOVERY (requires DTMF microphone)

(Documentation of this "feature" is difficult to comprehend but perhaps someone will figure out what it does.. I suspect that "RECOVERY" refers to returning the memories to their original state after changing the split memory layout.)

1. Hold down F and C.SEL, turn on power

2. Press D, followed by 7 on the microphone. "Inspection Mode" is now enabled.

3. To cancel, press and hold F and then C.SEL

"Note: Before recovery, the memory channels must be returned to the previous state (number of split memories, etc.)."

1533. Need 2-way UHF radios

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 22:26:54 UTC
From: edc@NOC.Vitalink.COM
Message-ID: <1992Apr27.222654.29168@NOC.Vitalink.COM>
Source record: 290557

I have a strang application that I need a little advice on from you radio gurus. I drive a Formula race car in SCCA road races. I've been thinking of installing a 2-way radio setup in the car to communicate with the pits. I looked into "racing radio" setups, (whatever a "racing radio" is. Looks like standard Motorola or Uniden 400Mhz UHF commercial radios to me), but they want at least $1500 for 2 4 watt handhelds with 1 noise cancelling headset and one set of earphones and a helmet mic. Sounds expensive. Defintely beyond my budget!

Anyway what I've got a few questions for you guy who are up on radio technology (the last time I played with ham radio, it had tubes and a code key):

1) Is is legal to use amatur frequencies for this type of non commercial use? (Hey, it's amatur racing, should be ok to use amatur radios, right? :-)

2) I don't remember code, I don't want to remember code, and I don't want to try to get my crew people to learn code (I have enough trouble getting them to remember what tire pressures to use on the fronts vs. the rears!). Now that there is a no-code licence, is that something that would be appropriate (read "that I won't get busted by the FCC for") for this type of application. What are the frequency limitations?

3) (The biggie) Where can I look for appropriate radio gear? And what can I expect to pay for a pair of 4-5 watt UHF handhelds. 400Mhz minimum, 800-900 Mhz would be better. I'm sure there are plenty of used UHF commercial handsets around if you know where to look. I just don't know where to look!

Any help, advice, or popinters to where I can get more information would be greatly appreciated!

Note: I don't normally read this group, but I'll try to monitor it for the next couple weeks.
I'd appreciate email replys if possible.

Thanks!!!!

I believe the tv station was sold (and moved to New Jersey) and the
radio station wasn't, therefore it was allowed to keep the three-letter
call sign under the grandfather clause...

1535. QSL Post Office

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-27 23:24:31 UTC
From: bruce@merlin.think.com
Message-ID: <BRUCE.92Apr27162431@merlin.think.com>
Source record: 290559

A few months ago, I asked for information and experiences regarding the QSL Post Office. I promised to follow up on my experience of using it, so here goes.

This is not "the bureau", this is a private venture started by a ham on Colorado. You bulk mail your domestic cards to him, along with 10 cents per card. He puts them in an envelope along with some advertising flyers and sends them. (His original goal was to offer this for free, and to offer W, VE, and XE coverage, but now it's 10 cents and US only.)

I was trying to keep up my habit of 100% QSLing, and I was way behind, so I tried the service out. My first attempt, using old information, resulted in a letter back stating the new 10-cent policy and a return of my VE cards. So, I sent along some $$ and some more cards, about 450 domestic cards in all, at the end of January. I received a nice note back thanking me and saying he was handling about 200 cards/day.

For a long time, I thought I got ripped off. I wasn't receiving *any* QSL replies. My experience has been that if I mail cards out as postcards, about 50% are given replies. I didn't expect that large of a return from this service, but I did expect a few replies from 450 cards! Also, I had thrown in a couple of cards to a friend (and one to myself under my old call), neither of which was received. I had all but given up and was considering writing a nasty letter.

However, during the month of April, they slowly started trickling in. One OM wrote a long letter back about his life, etc., but he did say he recieved the card on April 9. I haven't kept a count on recieved cards, but I've received a few dozen and they're still coming in. I seem to get one or two every night.

My hunch is that they are batched up by zip code or whatever, and that he sends on the cards on some kind of rotation. E.g., most of the cards I've recieved so far have been from call area 1. I didn't expect it to take several months for the cards to arrive, but that's OK.

So, if you're not in a hurry, and you have lots of domestic QSL cards to send, the QSLPO seems like a reasonable alternative, since it costs only about half the price of sending the cards as postcards. I'll probably continue to use this service for bulk QSLing.

Source record: 290560

I have a strange application that I need a little advice on from you radio gurus. I drive a formula race car in SCCA road races. I've been thinking of installing a 2-way radio setup in the car to communicate with the pits. I looked into "racing radio" setups, (whatever a "racing radio" is. Looks like standard Motorola or Uniden 400Mhz UHF commercial radios to me), but they want at least $1500 for a pair of 3 or 4 watt handhelds with 1
noise cancelling headset and one helmet setup. Sounds expensive. Defintely beyond my budget!

Anyway, what I've got is a few questions for you guys (and girls) who are up on radio technology
(when I last played with ham radio, it had tubes and a code key):

1) Is is legal to use amatur frequencies for this type of non commercial use? (Hey, it's amatur racing, should be ok to use amatur radios, right? :-) Would I even want to if it is leagl or would I be better off using commercial band radio equipment?

2) I don't remember code, I don't want to remember code, and I don't want to try to get my crew people to learn code (I have enough trouble getting them to remember what tire pressures to use on the fronts vs. the rears!). I understand that there is now a no-code licence. Is that something that would be appropriate (read "that I won't get busted by the FCC for") for this type of application. What are the frequency limitations?

3) (The biggie) Where can I look for appropriate radio gear? And what can I expect to pay for a pair of 4-5 watt UHF handhelds. 400Mhz minimum, 800-900 Mhz would be better. I'm sure there are plenty of used UHF commercial handsets around if you know where to look. I just don't know where to look!

4) What are the requirements to licence commercial band UHF radios? The trick part here is that there is no permanent base station. The whole setup moves from race track to race track, Althou it'll mostly be used at 2 tracks in the SF Bay Area.

Any help, advice, or pointers to where I can get more information would be greatly appreciated!

Note: I don't normally read this group, but I'll try to monitor it for the next couple weeks.

The local radio club that I belong to runs a 2 to 10 meter FM cross band repeater.

Rest assured that it is legal for you to go into the 2 meter and come out on 10 if you are a Tech.

The 10 meter side should be under a control operator and identify itself at regular intervals.

Enjoy.

>
> Can anyone explain this more exactly? How about grounding Ham equipment?
>

Many electrical codes call for (or did call for) the neutral side of the electrical system in your house to be connected to the cold water pipes, as the metal pipes made an excellent ground. Many of today's electrical codes require that, even if the ground is connected to the cold water pipes (if they're made of metal, not plastic) that the ground be supplemented by one or more additional grounding electrodes. This is required for electrical safety.

Presumably, what the articles is describing is the alleged danger of lead contained in the solder connecting the copper water system together either leaching out into the water (depends on the water acidity) or the chemical reaction from ground current passing through the soldered connection raising the lead content of the water.

Since the only place water can get at the lead (in the solder) is at joint connections, and then only at the "edge" of the cylinder formed by the solder around the pipe, it would seem to me that the danger of this is quite minimal, and that the article may be another example of over reacting environmentalist hysteria. Since I haven't read the article in question, that may not be fair, but newspapers generally don't get good marks for scientific accuracy.

I'd check with your local electrical inspector to see what your code says, especially if you're contemplating moving the ground.

In any case, if lead has seeped into the water system, running it for a few seconds before you use it will remove the "contaminated" water. Ham equipment generally has quite low electrical demands (unless we're talking "California Kilowatts"), and you won't generate enough ground current to make much difference unless you've got serious wiring problems.

Nah. Why not just leave that as an exercise to the reader and spare the League (and yourself) the paperwork and expense. Once you get DXCC on 10-80 on the non-WARC bands, you have pretty much made your point about grokking DXing and boasting to your buddies :-), at which point you don't need another trophy to remind you.

>able to afford direct return postage,

Well even postage sending QSLs to the bureau adds up. I spent about $20 postage on my last shipment to Newington, not to mention the $2/lb handling charge. In fact, since moving to California I have been pulling the JA cards and sending them directly to the JARL in Tokyo because the shipping cost to Japan is comparable to shipping the across North America and the paying $2/lb for outgoing bureau fees. Plus I figure this may reduce the bureau latency by a small amount this way.

Money is money and time is time, and $50 goes a long way in a place like Malaysia. I mention this because I think it is a mistake to trivialize the cost and effort of QSLing.

> or being able to send a
>full-color fancy QSL card, but to decide that one can't afford a
>simple one-color card (or a xeroxed piece of paper) seem to border
>on unethical. Did you tell people of this policy during QSOs?

Did *you* ask the DX station whether he QSLs when you made the contact, or do you expect him to voluntarily announce it with each QSO? Remember *you* are the person who cares about the QSLs, not him.

>I believe that a statement of "I don't reply to bureau cards" would
>be considered as grounds for disqualification in most of the major
>DX contests, by the way.

Bullshit. Such a person gets bonus points for honesty in my book. Besides, what is the relationship of contesting to QSLing? In particular, why should a person who hates QSLing but enjoys contesting get different treatment from someone who hates QSLing and doesn't operate contests? NB: By the way, if you really want to get revenge against a contester who doesn't QSL, make a note never to contact him in a contest again. The reward is small, but it pays out several times a year, year after year.

Also another note: I think answering QSLs is good manners, but I think it is important for the QSL seekers to temper their expectations somewhat. Why should someone allow QSLing to hamper their enjoyment of the hobby? I really enjoy getting on the air and making contacts. But if I hated QSLing, I wouldn't allow to the prevent me from getting

on the air and making contacts.

Corrected copy:

The Cadet Amateur Radio Club at West Point, New York
will conduct a special event station using club station W2KGY on
2 MAY 92 to commemorate the 190th anniversary of the U.S. Military
Academy.

Operation will be conducted from 0900 - 1700 EDT (1300 - 2100 UTC)
in the following frequency bands:
Phone CW
3.85 - 3.925 3.525 - 3.600
7.23 - 7.26 7.100 - 7.150
14.23-14.30 14.025 - 14.100
21.30-21.38 21.10 - 21.20
28.30-28.50 28.00 - 28.10

AMSAT Mode B (AO-13) When available.

A special QSL card will be available for all confirmed contacts.
An SASE must accompany your card. QSL Manager for this event is
KE2WF.

Hope to hear you on the air !

73 de KE2WF

>you think it should do?

I have a 97 and love it. First off, forget any of the scopes except
the 97. The others are unconciously gymped.

here's the good stuff.

It really does have a 50 mhz bandwidth on one channel. Less when running
dual trace.

The screen is adequately fast, though the display update does sometimes
lag the input by a fraction of a second. Think of it as a delay line.
For signals that vary rapidly, there is an envelope mode that turns on
all dots the signal crossed during the sample.

Fully isolated case qualified to attach to power lines of up to 600 volts.

A,B,A-B mode allows one to view all three phases of a three phase
circuit, say of an inverter.

Several setup and waveform storage memories. Waveforms can be recalled
to the display in any combinations.

Auto-setup. On repetitive signals, pushing this button picks the proper
sweep and vertical scale to display a reasonable waveform.

Digital zoom. works by changing the sweep and trigger delay to keep
the center of the screen centered.

Trigger works very well and is displayed on the screen.

Several transforms available including smoothing, averaging and pass
filters.

Delay can be samples, events or sweeps.

Scope can accumulate twice the screen display's worth of samples which makes the pretrigger queue fairly deep.

Optically isolated data output can dump data, memories, the screen in either epson or HP format and accept remote control commands.

Voltmeter mode works very good, is fast and can display a mini-scope trace even on ohms. Min/Max mode displays min, max, average all in one display. AC is true RMS.

Is small enough to be carried almost everywhere. I hauled mine to the dragstrip this weekend to use to observe a radar gun output.

If the ni-cad pack goes dead, you can remove it and install dry cells. Nice touch.

Battery life is good. Days with the backlite off, spec'd 4 hours with it on. I've gotten more.

Here's the bad stuff.

You gotta kiss Fluke's ass to get 'em to sell you one. They began advertising the scope months before production started. I started trying to get mine back in November. Raising hell, including calling Fluke's president, did no good. I got mine about a month ago.

Fluke has honed the art of unbundling to a fine edge. The scope is reasonable but by the time you get through equipping it, you've got real money involved. Examples: Serial interface - $150, PC interface software - >$500, Amp clamp $100-$150 (ac or dc), Carrying case - $70 to $150, Service manual - $50 and so on.

Scope probes are fragile - I broke one the first day - and not anywhere near the quality of Tek probes.

HP printer output is not really PCL. It drives my clone laser printer fairly well (actual screen sized dump, rotated to landscape) but I've had a hell of a time trying to inport it into publishing software - one reason I bought the scope.

Screen dump is very coarse.

Backlite is inadequate. Needs to be much brighter.

Keys are heavily overloaded. Too many softkeys. Even trigger level is on a soft key.

Voltage readings must be taken through the the A channel probe. It cannot be routed to the bannana jacks where ohms and such are done.

When the mini-scope display is up on the ohms screen, the sweep is fixed.

It has a dumb software limitation that one trace must always be on. That means you can't just turn off both channels in preparation of recalling stored traces. You have to turn your traces on and then go back and kill the real time traces.

The A/D is noisy, displaying a couple of pixels off of baseline even with the input shorted, either with a shorting plug or by selecting "gnd" on the input selector. It appears to be independent of range.

Input channels share a common ground. While this is typical of analog scopes and at first blush would not seem to be a problem, you find yourself using the scope in situations where separate grounds would be nice. Fluke will sell you a ground isolator - for a price.

The front of the display is extremely glossy which means reflections of overhead lights kills the display. I usually turn the lights off and use bench lights when using the scope. This is really dumb and unnecessary.

The highly touted signal/function generator is useless. Only a couple of fixed, oddball frequencies. This is obviously a case where a few bytes were available in ROM so the developers gave marketing something else to crow about. Forget it exists when evaluating the scope. The manual kinda indicates arbitrary waveform might be available using the PC software but I don't know since I refuse to pay the extortive price.

The fluke reps were very unresponsive. I got more info from distributor salesmen. I originally contacted Fluke to obtain a unit to do a magazine review on. Even this didn't faze 'em. They're not gonna like my review.

The scope is actually a Philips. I HATE philips scopes. That was a major reservation against my buying the unit. I know Fluke could have done a better front panel.

If you get one, save your money on the serial interface. Just to to radio shack and get that IR LED/photodetector they package together and wire them through level shifters to an RS-232 connector. I think they'll probably insert into the holes in the scope body. The factory cable powers the level shifters from the RS-232 handshake pins. This is a real f*ckup which precludes using a serial to parallel converter on parallel printers. First time the converter handshakes (typically between each byte for the cheap portable ones), the interfaces loses power and the dump is gone.

I'd make the same purchase again mainly because there is nothing else out there. The Leader is a joke. So are the new Tek handhelds. For a third more money ($2400 list), you don't even get trace annotations or on-screen data. I had one in for a couple of days to evaluate while waiting for the Fluke. Tek apparently thinks their isolated input channels and CRT are going to sell the unit. NOT!

I like the scope and use it about 85% of the time but I do still the 465B sitting on the bench.

You should never let Ni-Cad batteries be discharged down to 0 volts. What
you should do is run the battery down until the transmitter will not work
properly (Be careful not to drain them too much. The radio may still be able
to receive). Then test the voltage with a multi-meter and use the result
in your calculation.

> volts) and that the car is supplying 13.8 volts then I would calculate the

Reducing the voltage is probably not neccessary as long as you remember not
to leave the battery charging for too long.

1548. WANTED - PRO-2005 mod to close gap

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 09:01:01 UTC
From: chardi@p4.cs.man.ac.uk
Message-ID: <4650@m1.cs.man.ac.uk>
Source record: 290572

I'm looking for a modification (preferably as simple as possible) to the Realistic PRO-2005 scanner which will enable me to receive television sound in its "gap" (this is between 520MHz-760MHz if memory serves). Even closing the gap slightly would be a help, as I need to receive TV sound from UHF channel 55 (which is just below the top limits of the gap).

Thanks a lot for your attention.

Ian.

Message-ID: <1992Apr28.125447.29582@magnus.acs.ohio-state.edu>
Source record: 290574

A while back there was some discussion in this group about the new wind profiler radar systems, and the problems that they will cause for hams.

I came across this little item today and felt that I should post it here. Note: I do not advocate the following procedures as reasonable responses to local interference problems.

[Date: Wed. 22 Apr 1992 12:54:15
[From: Bear Giles <bear@tigger.cs.colorado.edu>
[Subject: Risks of a modern weatherman
[
[(From the bulletin board down the hall...)
[
[Network Wind Profiler Severely Damaged
[
[A wind profiler in OAR's Wind Profiler Demonstration Network (WPDN) was
[severely damaged by several shot-gun blasts late last week. On March 28,
[just before sunrise, two men and one woman were pheasant hunting in
[southern Nebraska [and] came across the McCook wind profiler and mistook
[it for an alien spacecraft. Frightened, they fired a number of shots
[damaging the profiler antenna and the electronics shed. Furthermore, a
[Forecast Systems Lab (FSL) technician who was in the shed conducting
[routine system checks was taken hostage by the hunters. After being held
[captive for nearly two hours, the technician's partner arrived and
[explained to the hunters what the profiler really was. The hunters
[then fled and so far, they have not been apprehended by law enforcement
[officials. Profiler damage is estimated at $150,000.
[

I knew those new fangled things were gonna cause problems :-)

Although I don't remember the exact date,
it was right after World War II.

I just "happened" to get a chance to read all of the QST's from
about 1940-1950 last Christmas and remember the discussions.
Prior to then, for example, the "0" district was a "9".

1553. ARLB037 - Increase in FCC enforcement actions

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 13:31:01 UTC
From: lhurder%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <599@arrlhq.UUCP>
Source record: 290577

ZCZC AG59
QST de W1AW
ARRL Bulletin 37 ARLB037
>From ARRL Headquarters
Newington CT APRIL 26, 1992
To all radio amateurs

SB QST ARL ARLB037
ARLB037 FCC Levies Fines

The FCC has begun what is expected to be a wave of enforcement actions. Several hundred cases are reported to have been on hold awaiting the granting of authority to the Commission's various bureaus to levy higher monetary fines. That authority, granted April 15, raised the maximum fine that can be levied without approval by the commissioners themselves to 20,000 dollars. Thus far only a handful of actions have involved amateurs.

On April 24, 1992, the FCC issued three Notices of Apparent Liability affecting Amateur Radio. David Plourde, N1IZR, a Technician class licensee in Lewiston, Maine, was issued an NAL for 10,000 dollars, for using non-type accepted equipment to transmit in the Citizen's Band. Also on April 24, a non-amateur in Tampa, Florida, was issued an 8,000 dollar NAL for transmitting on the Amateur 40-meter band.

On the same day Donald Bishop, N0EA, an Amateur Extra Class licensee, was issued an NAL for 10,000 dollars for transmitting from a mobile installation on frequencies near 7420 and 15050 kHz.

Finally, also on April 24, the Private Radio Bureau's Special Services Division issued the first Order to Show Cause and Suspension Order to amateurs in several years as the result of an investigation into volunteer examiner practices. Charles P. Pascal, WB6CIY, and Sandra V. Crane, N6TFO, both Amateur Extra Class licensees, have been ordered to show cause why their Amateur operator licenses should not be suspended and their station licenses revoked.

These orders are the result of an FCC probe into volunteer examinations given in August and September, 1991 by Pascal and Crane.

If you want to protect your batteries, get a variable voltage
regulator from Radio Shack. Set the output voltage at the full
charge value of your batteries. You can also add current
regulation, but a small resistor in series after the voltage
regulator is sufficient to limit the worse case current.

Source record: 290480

Well, here it is Tuesday and I'm still trying to get my wits
back after Dayton. What an overwhelming, exhausting experience!
I was at a booth peddling software for most of the time, but
got out to the flea market for a few hours. Weather was utterly
miserable on both Saturday & Sunday. The outdoor functions suffered
terribly as a result. The predicted parking debacle simply didn't
happen - $5/day right next door, plenty of room.

The HamVention people told me that attendance was about equal to last
year - 32K - but I wasn't there last year. Seemed to me that nowhere
near 32K people actually came. Any experienced Dayton-ers out there
care to comment on attendance?

FWIW, my booth (Northern Lights Software) ran out of disks, manuals,
and almost ran out of order forms. Yeah!

1557. IBM PS/2 Model 25 Graphics Adapter changes Wanted

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 13:56:13 UTC
From: ron@nsu.DNET.NASA.GOV
Message-ID: <9204281354.AA07030@east.gsfc.nasa.gov>
Source record: 290481

I have an IBM PS/2 Model 25 that I would like to use on SSTV and WEFAX. For those of you that are familiar with this model you know that it supports MCGA Graphics (an IBM pre-VGA low cost production alternative) which supports 320 x 200 resolution in 256 colors. The graphics adapter is built into the system board.

What I would like to do is add a standalone graphics card (VGA or better) and an external monitor (the monitor is built into the model 25). I have asked several people about the possibilities of doing this and received no "for-sure" answers. I was told at one time that the onboard adapter could be disabled through dipswitches on the system board but they didn't know which switches or their settings. If any of you have dealt with IBM direct with such inquiries you know they don't release that type of information readily.

I understand this is an old 8088 machine and most would say it is time to upgrade anyway. At present I'm looking for a low cost alternative and this would actually be my first step toward upgrading (a Super VGA card and Monitor).

I also know this request may be better served through another newsgroup but I do not have direct access to the other newsgroups. Currently I am subscribing to this group via the INFO-HAMS relay at UCSD.EDU.

Thanks for any assistance.

1558. DSP-12 vs DSP2232 shootout

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 14:02:26 UTC
From: gingell@aurw6b.UUCP
Message-ID: <9204281317.AA08241@aurw6b.aur.alcatel.com>
Source record: 290482

I feel I must respond to Bob McGwier, N4HY who posted what seemed to me to be an unsolicited advertisemnt for the AEA's DSP2232. As others on the net have observed: "It would appear that you are a software (?) developer and are working hand-in-hand with AEA on the 2232". - and presumably therefore getting a royalty for each one sold. If so then you should NOT post unsolicited comments about it and worse unsolicited snide remarks about the competition. Its not Netiquette.

As an owner of a DSP-12, made by Bob's hated (my deduction from the tone of his remarks) rival, L. L. Grace I must say something in their favor.

The DSP-12 is a brilliant piece of hardware, mine contains a V40 processor a 56000 DSP chip, 1 Meg of RAM, programmable bandwidth A/Ds and D/As and many more features. At present it supports all satellite modem modes, RTTY, AMTOR and lots more. Since it contains a DSP chip and programmable I/O the skys the limit as far as future capabilities. If there is interest on the net I will post a more detailed description of its capabilities and features.

The single most important feature is IT HAS AN OPEN ARCHITECTURE. That means for $25 and the signing of a non-disclosure form you get a complete schematic, and a toolkit including all the V40 source code AND a 56000 assembler. Software updates are FREE, every time they add new features they upload the ROM code to Compuserve and you can dowload it and program a new EPROM. Also updates to the toolkit for the cost of a floppy and the return postage.

I just returned from a trip to Dayton where I spoke to Brooks van Pelt the man behind the DSP-12. From what he says many hams round the world are working on software enhancements to the DSP-12 and as an owner I am excited - I will get the fruits of all that work for FREE. I am thinking of writing some applications for it - the trouble is there are so many possibilities its hard to choose - how about a noise reduction unit a la JPS - or a set of programmable filters, or Pactor or or ....

By the way, I have no commercial interest in L L Grace except as a very satisfied customer. I also have their satellite tracker/tuner board.

1560. The Electronic Repeater Mapping Project

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 14:27:36 UTC
From: steve@wattres.San-Jose.CA.US
Message-ID: <1992Apr28.142736.28406@wattres.San-Jose.CA.US>
Source record: 290484

In case you haven't seen the various messages about the Electronic Repeater Mapping Project that I am now running, here is the help message from the server. The server is at "repeaters@wattres.sj.ca.us". If you want *another* copy of the help file, send a message with ONLY the word "help" in the body, and it will be sent.

[begin help message]
The server will only recognize one repeater per mail message. If you want to submit multiple repeaters, you will have to submit multiple mail messages. A daemon will auto-reply when your message has been processed. If your message has some sort of evil error in it (i.e., one of the required lines is missing or undetectable) it will send you a message with the error and a copy of this file.

The information I want:

The callsign (both Canadian and US repeaters welcome!), input/ouput, who you are, when you sent it, and where the repeater is. And a whole bunch of (mostly) optional data.

The information format I want:

Each line starts with # and then 4 upper-case letters (hopefully mnemonic) describing the info on that line. The rest of the line is (more or less) free form.

The *required* lines:
#CALL (the callsign of the repeater)
#OUTP (the output frequency of the repeater)
#INPT (the input frequency of the repeater, or just + or - for standard offs)
#LOCA (the longitude, lattitude, and HAAT of the repeater)
#SEND (the e-mail address of the sender)
#UPDT (the date & time of last update)

The other useful lines:
#TONE (the CTCSS input tone, followed by '/' and output tone, if there is one)
#COVG (the primary coverage area)
#911C (the 911/emerg autodial code, IF THE REPEATER OWNER OKs GIVING IT OUT)
#AUTO (autopatch facilities available?)
#CLSD (if this repeater is closed, who can use it)
You only need to put a #CLSD line in for closed repeaters.
#AFFL (affiliation i.e., RACES ARES etc)
#SPON (sponsor of the repeater)
#CONT (how to contact the sponsor, name/addr/phone #)
#LINK (links to repeater, callsigns and frequencies, or something like CONDOR for large nets)

#COMM (a comment, as many #COMM lines as you like)

For example (this repeater does not exist):
#CALL KZ6QRM Mobile Uncoordinated Repeater (my car)
#OUTP 440.15
#INPT 222.22
#LOCA 122 01 09 W / 37 18 30 N / -2m
#SEND steve@wattres.sj.ca.us (Steve Watt)
#UPDT Thu Apr 02 00:39:58 PST 1992
#TONE 100.0 / 131.8
#COVG My house, special events
#AUTO It's a car without a cellphone. No autopatch.
#CLSD Only availble to people with the callsign KD6GGD. ;)
#SPON KD6GGD and his performing Corolla All-Trac
#CONT E-mail is the only way. steve@wattres.sj.ca.us
#LINK Only to my HT
#COMM I hope you're at least scanning this message. Send the registrations
#COMM (for active repeaters only, please) to "repeaters@wattres.sj.ca.us".
#COMM It's an ICOM 901A with a 220 band unit. It also spends most of its time
#COMM off, when I'm not in the car. It is not in repeater mode when I am in
#COMM the car. So it's not a terribly useful repeater, unless I say so. :)

If you are having difficulty finding the lattitude and longitude for the
repeater, try the Geographic Name Server at UMichigan.
telnet martini.eecs.umich.edu 3000
I haven't tried this service, so I can't vouch for its accuracy.

Once again: The address is repeaters@wattres.sj.ca.us. Don't send messages
there that you expect somebody to read. Send those to me.

Also: PLEASE MAKE SURE THE REPEATER SPONSOR OK's GIVING OUT THE EMERGENCY
CODE! If you include other codes in your message, make sure that it's
OK to give those out, also. Som repeater sponsors object to having the
codes freely circulated, and others charge money for them.

>--scott

Yes, especially at MF and HF, minimum discernible signal numbers
in ready-for-prime-time radios are about as moot as frequency
response in ready-for-prime-time consumer audio gear. *But*...

...from my experience, and from test numbers I've seen, the
R-390A, at 20-kHz tone spacing, blocks much more easily than
middle- and high-end modern radios, and, with 20-kHz tone
spacing, exhibits a 3rd-order two-tone dynamic range no higher
than 90 dB or so. We've tested several modern transceivers now
that, at 20-kHz tone spacings, block at over 140 dB above MDS --
excellent! (One or two, we've even been afraid to push for fear
of damaging front-end components. Blocking numbers this high also
indicate very clean synthesizer performance, since synth noise
would "onset" before blocking and disallow its measurement if the
synth was noisier than the front end is strong.)

With its tracking-preselector design, however, the R-390A tends
to beat modern, wideband-front-end radios at very wide tone
spacings. In other words, it may tend to desense less and create
fewer IMD products from signals hundreds to thousands of
kilohertz away because its front end rolls them off.

(This is a public response; I've also responded to Jim directly).
I consider this a good idea, and will save as a body further pro
and con on this topic for possible recommendation to *QST*'s
technical editorial committee (of which I'm a member). Thanks!

Possible snag of which we must be aware, though: Old gear is old,
even if it's sat around in unopened boxes. *Used* old gear is, in
effect, even older than unused specimens of the same animal. Of
course, we could agree that all units would have to operate
within spec at the outset, and be unmodified, but we need to keep
in mind that we would not necessarily be knowing *exactly* what a
new Yesteradio does when compared with a new Todayradio. I
suppose that this factors into the horse race, because "RF is
little better today" proponents seem to accept the concept of
pitting Used Old against Unused New.

Trivia: Some components degrade nondestructively, yet
qualitatively, over time. Having taken pains to get inside my
51J-3's PTO and replace its tuning-range-adjust inductor to
reachieve exactly 100 kHz/turn, I speak from exhausting
experience! The 51J-3's PTO's slug(s) change permeability over
time, finally so much so that the range-adjust coil itself runs
out of range. My 51J-3 PTO, I suspect, is one the few around with
a T-30-6 toroid aboard...

qrp cw rig. I am familiar with most of the multi-band qrp radios
since I have been active in qrp work for many years. But now
the multi-band rigs won't serve the need of a small lightweight and
easily transported rig.

I have been comparing the MFJ and the A&A radios but only through
their literature. Does anyone have any direct experience with them?
I've read the reviews but first hand reports are much more revealing.

Another possibilty is for me to build or purchase one of the small
kits available about ten years ago - perhaps an 8P6 or Micromountaineer.
If anyone has such a rig they would part with, I'd love to hear from you.

thanks and 73,

>Many electrical codes call for (or did call for) the neutral side of the
>electrical system in your house to be connected to the cold water pipes,
>as the metal pipes made an excellent ground.

When all plumbing was metal this was a good grounding method. The prolif-
eration of PVC pipe in plumbing means that you probably won't have an
uninterrupted run of metal pipe into the soil. Newer homes may not have
metal plumbing anywhere between the street and the tap. This is why you
shouldn't use plumbing for a ground, not chemical reactions.

>Many of today's electrical codes require that, even if the ground is

>question, that may not be fair, but newspapers generally don't get good
>marks for scientific accuracy.

This assumes copper plumbing, where the connections are soldered. Older homes used lead-plated iron pipe. The lead was to keep the iron from rusting. Scare-mongers have taken this to hysterical heights, under the mistaken assumption that the lead from these pipes continually leaches into the water. However, if you've ever looked at the inside of water pipe that has been in place for a few years, you note that the inside is completely coated with minerals. Some of these coatings are sufficient to reduce what was a half-inch diameter to a quarter-inch. Once these hard mineral deposits form, there's no contact between the water and the lead, hence no lead in the water, grounding or not.

>I'd check with your local electrical inspector to see what your code
>says, especially if you're contemplating moving the ground.

Excellent advice. But to be on the safe side, I wouldn't rely on plumbing for a ground anywhere, anytime.

>In any case, if lead has seeped into the water system, running it for a
>few seconds before you use it will remove the "contaminated" water.

Only if bare lead is near the tap. If it is 80 feet away, it may take a good bit more time to flush 80 feet of line. If there's no bare lead, it's irrelevant.

>Ham equipment generally has quite low electrical demands (unless we're

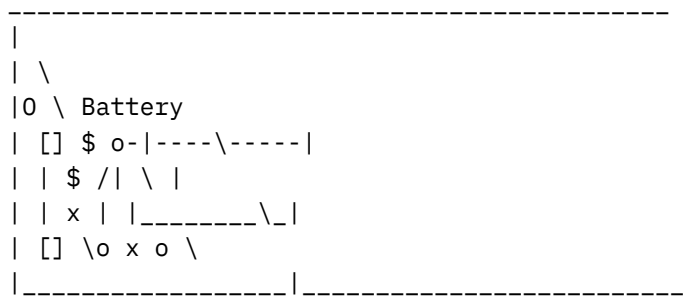
Message-ID: <920428100230.202058c4@WINROCK.ORG>
Source record: 290490

I have read of requests for modifications for the TM731A. I received
a copy of a mod for MARS/CAP operation which makes the TM-731A capable
of receiving (and transmitting) from 136 - 174 Mhz and 400 - 500 Mhz.
The sheet states this is NOT the standard modification, and should be
used only for overseas markets, experimental applications, or laboratories
only.
Transmitter specs will vary from published in-band specs. VCO alignment
may be required depending on the actual operating frequency.

Note: I have performed the modification, but have NOT experimented with
the transmit capability out-of-band. The receive capability is as good
as the modification sheet says.

1. Remove the top & bottom cover.
2. Cut resistor R25 on the control unit. This resistor is on the
bottom side of the tranceiver. Do not confuse it with R26 on
the top side.
3. Remove the silver colored screws from front panel chassis (t
on each side, 1 on top, 1 on bottom)
4. Carefully pull front panel away from the body of tranceiver...
Do not disconnect any cables.
5. On control unit, install jumper wire as shown in diagram below.
6. Reassemble and connect power.
7. Reset the microprocessor 2 times. To reset, press & hold the
MR key and turn power switch on. First reset places tranceiver
in memory mode, second reset places tranceiver in VFO mode.

I have tried to illustrate with ascii the diagram shown
on the sheet. The $ represent location of resistors.
Place small jumper between the two x's.



Hope this information is helpful. I do not have the "standard" mods.

|>

And what about when the person on the 10 meter side is a GM or a DL or an ON??

If you don;t have priveledges on HF, then it is third-party traffic under the license of the control operator. And we don't have third-party agreements with any of those countries.

By the way, this is not theoretical. I hear Europeans on the US 10 meter repeaters (with cross-band links) all the time. Before it went away, I personally worked both G and GM from my IC2AT down at the local Dairy Queen. That raised a few eyebrows.

I think experienced visitors to the Hamvention might tell you that attendance was down due to the fact that they are accoustomed to crowds being so great that they simply could not move in some sections of the indoor area. That has been relieved somewhat in the past few years because of the expansion in the floor space. All of that area where Yaesu and Ten Tec are is brand new.
Also the tents outside (Mendalson, Icom, RS, and Kenwood) soak up a lot of people.

But then, who cares about totals?

I noticed the talk in boys were still telling people to go to the malls and take the shuttle busses even though parking was no problem in the HARA area. Capitalism reigns! If there is a market, supply rises to meet the demand and take your buck!

We were selling outside (the "Friendliest spot in the flea market"). Did ok on Friday. Did 25% of what we normally would do on Saturday. Even took beer home, too cold to drink it. But we were prepared just in case the sun came out.

1572. SUMMER `92 CALLSIGN PROJECT UPDATE

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 16:28:16 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <kvqv90INNrtb@west.west.sun.com>
Source record: 290496

Details/Info about The Summer of '92 CALLSIGN PROJECT

Rusty, N7IKQ and myself AA7BQ, are putting together a summer distribution of the FCC callsign database. The database, which is roughly a 50 Mb ASCII text file, will be distributed along with some free (shareware) UNIX C source code to handle fast indexing and retrieval.

The May 1 cut of the database has been ordered and should be available within about 8 weeks (yes, the government is slooooooow).

Distribution Media, Formats, etc.:

The preferred distribution format is 1/4 inch cartridge tape, with QIC-150 (DC6150) being the best. We can also support QIC-24 (DC600A/60Mb) tapes, as well as 9-track reel-to-reel tapes. Default data format is UNIX tar unless otherwise specified. Other formats include 'dd', 'cpio' and (gasp) EBCIDIC 'dd'. No source code will be available with the 'dd' formats.

Absolutely no floppy disk copies will be made.

Below is a sample entry for a single callsign from the data file (there are in excess of 500,000 such records in the file):

KB0A|FORRETTE||CLAY|H|28321|87048|97048|RT 2 BOX 343|SIOUX FALLS|SD|
57103|3 MI SW OF|BRANDON|*|E|||*

Fields are separated by the | character, and are:

call|lastname|jr/sr|firstname|mi|dob|effective|expires|mail_street|
mail_city|mail_state|mail_zip|loc_street|loc_city|loc_state|class|
previous_call|prev_class|process_date

Missing fields are not applicable. Fields with * are the same as corresponding field elsewhere: in the example above, the first * means that the location state is the same as the mailing state. Dates are in the mod(100) year plus julian days format.

Copying Costs and Shipping:

The cost is $20 per copy. You must supply the recording media along with a self addressed and prepaid mailing label. Preferred shipping is via FED-X, UPS, and USPO in that order.

Proceeds will help cover the cost of obtaining the data from the National Technical Information Service (NTIS) which currently

stands at over $700.

Ordering:

Please e-mail all requests to:

Fred.Lloyd@West.Sun.COM (internet)

1575. TH-78A: Looking for info and mods

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 17:17:48 UTC
From: gurney@cps.msu.edu
Message-ID: <1992Apr28.171748.8397@msuinfo.cl.msu.edu>
Source record: 290499

Well, I couldn't resist the "Kenwood Cash" and low prices of Dayton...
I bought a new TH-78A dual-bander. So far I'm very satisfied with the
radio, although I'm confused why some things are the way they are...

For instance, the 78A has an option to make the main and sub-bands
both UHF or VHF. This means you can monitor two 2-meter stations or
two 440 stations or whatever. Really nice feature that the 77A doesn't
have. You can even be scanning a 2-meter region in one band and
scanning another 2-meter region on the other band! Pretty nifty.
Anyway, my problem is this: when I try to listen to the somewhat-local
NOAA station, I get absolutely NOTHING when it's dialed into the "Main"
band (that is, the left frequency display.) If I dial the frequency
into the sub-band (right frequency display) I get almost the whole
signal bargraph lit up. It doesn't matter if it's in "dual" or
"single" mode -- if just the "right frequency display" is active (no
receiver on the "left frequency display") NOAA still comes in fine.
If I try just the opposite, with nothing on the right but NOAA on the
left, I get no signal. Can anyone explain this? Has anyone else with a
78A experienced anything similar? Is my radio destined for service
with Kenwood?

Secondly, Kenwood was taking names and addresses at Dayton of people
who wanted information on how to modify various Kenwoods. I forgot to
ask if they were sending info on the 78A. I assume it will have a
similar mod to allow extended receive range. I'm _REALLY_ interested
in this if anyone has any info.

So if you know anything about either of these two items, please let
me know!

Thanks and regards,
Eddy

>technical editorial committee (of which I'm a member). Thanks!

I think this is a great idea. Not only would it be interesting reading, but it also would help out new/poorer/cheaper hams who can't afford a kilobuck for the average radio reviewed in QST, but instead has to run whatever he could buy at the average hamfest for a few hundred bucks. I'd personally be interested in whether or not the Drake 2B I had as a Novice 20 years ago was as good a receiver as I remember it being. (One of these days, I'll spring for another one...)

>Possible snag of which we must be aware, though: Old gear is old,
>even if it's sat around in unopened boxes. *Used* old gear is, in
>effect, even older than unused specimens of the same animal.

I'd approach this problem in two ways: 1) Noting that the problem exists in the first place, and 2) acquiring the radios to be tested on the used market anonymously, and then performing whatever tuning up and repairs are within the capabilities of the average ham. Get the manual from HI Manuals, follow whatever instructions it provides as to aligning the radio, fix obvious problems, and then let the lab loose on it.

>[...] the "RF is little better today" proponents seem to accept the concept of
>pitting Used Old against Unused New.

This is inherent in such a horse race unless the guys in the lab have developed a time machine we don't know about..

One more note: I think Jim deserves credit in the article (if it winds up as one) for coming up iwth the idea...

Just another data point in the code vs no code wars: A friend of mine
who was initially attracted to ham radio by NoCode has passed the tests
for and just received his Extra class license.

1580. New Kenwood Dual-HT 78A

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 17:55:35 UTC
From: svec@rtsg.mot.com
Message-ID: <1992Apr28.175535.26766@rtsg.mot.com>
Source record: 290504

This new dual band HT and 4 other new Kenwood radios were featured on this month QST page-3. The ad said "See it at Dayton"; Did anyone out there see or buy one? Anyone know the specs, features, bells & whistles? Of particular interest is "out of band Receive" capability. e.g. a number of dual band HTs now adays cover (+/- a few megahertz): 118-136 AM 136-174 FM 420-500 FM 800-950 FM
I wonder if the 78A can do all thhat (I believe the 77A had a few holes in the receive around 460 and again around 850 or so while the Icom W2A more or less did all of the above and the new ALinco does much of the above with a few holes in the coverage).

Would be nice if they picked up 222-225 RX.

...thanks in advance for any info... Larry - KD9OF

1582. Help with Mobile HF radios

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 18:14:53 UTC
From: hatzakis@fovea.stanford.edu
Message-ID: <HATZAKIS.92Apr28181453@fovea.stanford.edu>
Source record: 290431

All:

I am looking at buying a mobile HF radio and have no idea what
the market is like these days. What is out there in the $600-$700
price range for mobile HF tranceiver with general coverage receive
capability ? Ie., Kenwood, Icom, Yaesu... whatis the generally preferred
radio for this application...?

Thanks, in advnce for you responses, Mike WB2TBQ, Stanford University

1583. HF Weather with FAX card ??

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 18:17:44 UTC
From: hatzakis@fovea.stanford.edu
Message-ID: <HATZAKIS.92Apr28181744@fovea.stanford.edu>
Source record: 290432

I just saw an advert for an AEA (???) FAX or packet card that alllows weather transmission reception with computer and general coverage receiver. I would love to know more about this, does anyone have any info, know who sells this stuff and is it worth the toying around ??

Thanks, Mike WB2TBQ, STanford University (New York Transplant, although once a '2', allways a '2' !!

> mostly what I am looking for is the equasions that give the part values
> that inturn give the frequency. I am sorry that thesr are rather stupi
> proiablems but I am a little confused. (and rapidly getting more so)

The resonant frequency equation is derived from the reactance equations for
inductors and capacitors:

Xl = 2*pi*f*L
1
Xc = --------
2*pi*f*C

In a resonant circuit, Xl = Xc. Using a little algebra, solve for "f"
and you have the above formula.

One other point - there is another consideration, called "Q". Q is a
measure of "Quality", defined as the ratio of R divided by X in the
circuit. (either X is ok, since they are equal at resonance)

So, while many values of L and C will produce the right frequency, there
will be different Q factors. If the Q is too low, the circuit will not
oscillate because there is too much loss in the R of the circuit.

>2: I think that the above equasion will give me the alterations nesicary to
> change the inductor from a icoil of six wires to a ferrite rod/lopstick
> .. will that then give me the new capacitence? Will I have to alter the
> values of any other parts as a result.. I suspect so but HOW do I
> determin there new values.. (dont mind being pointed at a few books
> if that is the easiest way to answer).

If you are just replacing the inductor (L) with another type of inductor
(L), then Q doesn't change and the rest of the circuit is fine. One
thing to keep in mind is that certain ferrites work better at some
frequencies than others. Most loopstick ferrites are meant for
broadcast band (550 KHz to 1600 KHz) and may not work at 100 MHz.

>3: I *think* that to put my amplifier in to this circit I would replace Q2
> with my amp or amp chip... but what effect would that have on the rest
> of the circit? Is that the easiest way or even the right way to amp
> my signal????

The components of an amplifier are built around the active element. You don't say what you are using - what transistor or IC. (I see "2n222" in the diagram, but maybe that is "2n2222" ?) Most of the work in circuit design is in creating the input matching, output matching, and biasing for the active element. So, if you change the active element, you change the values in the amplifier.

>4: This is the realy stupid one so brace yourselves.
> I still dont realy understand the total inner workings of a tanked
> oscilator. I think I see how C7 would create the carier frequency with
> its charg and discharge, but I dont see how everything left of Q2 is
> being powered. I understand and can recognise the operational bias on
> Q1 but as I understand it the whole transmiter is driven by the
> changing voltages acrost R1, R2, R4,and R7. How does this drive the
> mic. I just see the current as running straight to the ground here?

C7 is a bypass capacitor. It keeps RF off of the power supply leads.

The tank is actually the variable capacitor and L. Feedback is from collector to base via C6. An oscillator works by satisfying two conditions - 1) the loss in the tank is less than the amplification of the active device. 2) the feedback signal is applied in-phase.

>5: If I do build a small transmitter like this one would a regular audio amp
> be able to increase my signal strength? If so what is the ratio, or is
> there a equasion to determine it (would a 15 wat audio amp give me
> a 15 wat signal?)??...

No. The extra audio would overdrive the RF amplifier and "splatter" the signal. You can't get more than 100% modulation.

>6: Lastly can I convert the schematics I have been reading for short wave
> amplifiers to these FM bands..???

I'm not sure what is meant by "FM bands". You can scale an amplifier to another band by keeping Xl and Xc constant. However, when you go above 30 MHz the values of L and C become very small (as frequency increases, L and C decrease). In many cases, the circuit is changed quite a bit to deal with small capacitances having very low Xc values due to the large values of "f".

I think this schematic does AM, but I'm not sure.

I have two SX-100 receivers. One is "as bought" which means pretty, but
unrestored electronically. The other has been refurbished, recalibrated,
re-peaked, and has had some aged components replaced.

Until I got the refurbed model, I didn't know just how bad the other one
was. The difference between the two has driven home for me the point that
these things do age and do deteriorate.

I think Jay's suggestion is excellent.

This might help, at least for starters. All this does is take a list
of lines expressed in terms of lat & lon and use a brain-dead mercator
projection method on them, plotting them on an 8" square in units of
points (1/72"). It doesn't create a closed path, so you can't do
shading of the interior. It will, however, accept the location of
a station and plot it. I have included the locs of two local packet
stations so you can get the idea. Hope this helps,

Marshall Jose WA3VPZ

1587. 2 meter ACSSB, Anyone ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 19:03:48 UTC
From: perry@hpfcmgw.FC.HP.COM
Message-ID: <19530035@hpfcmgw.FC.HP.COM>
Source record: 290509

The bands are clogged, all repeater frequencies are allocated up through 300 GHZ. What do we do ? Can we develop more efficient spectrum use ? Maybe our experimentation could forestall the selling of more of our bands to the commercial interests if we showed them the way.

Has anyone ever played with ACSSB ? I just read the article again in the Handbook, and ACSSB looks like the greatest thing since NBFM took over the 2m band 20 years ago. 20 years ago, our oscillators were still a little jittery at 146 MHz, so SSB was tenuous. Have we really done nothing for 2m repeater modulation for 20 years ? For shame.

What is ACSSB, you ask ? It is conventional SSB (yeah, HF technology) with a pilot tone just above the voice passband. The pilot tone is a constant level (30 dB?) below the carrier and is used for two purposes. First, the receiver "locks on" to the pilot tone by using it as feedback to the PLL - no more SSB "Donald Duck" ! Second, the pilot tone level is used as feedback to adjust the IF stage gain, giving a constant audio level. This eliminates the picket fencing that mobiles get, due to multipath. ACSSB also compandors (the "C"), so it has a good S/N ratio.

The advantage of ACSSB is that it only takes 3 KHz of bandwidth while NBFM takes 6+ KHz.

My idea for ACSSB is to develop it and allow ACSSB repeaters between the existing NBFM repeaters (6+3 < 10). If NBFM is at every .010*X, then ACSSB could be squeezed in at every .010*X+.005. This would essentially double the number of repeaters our bands could support.

What about interference to existing users ? I don't know. Maybe we could get away with it because SSB is AM and NBFM is FM. To encourage experimentation in ACSSB, we could grant interference priorities to ACSSB repeaters (i.e. NBFM repeaters cause no interference to and must accept interference from ACSSB repeaters). That's probably controversial, let's hear your opinions.

I've only been a ham for 4 years and don't know where to look in the literature. Was ACSSB abandoned for good reason ? Are there mods that can be made to a cheap transceiver (e.g a CB) that result in ACSSB ? The next step would be a 11m/2m transverter and there you are.

1588. Re: Kenwood TH-27A/77A Info Wanted (summary - long)

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 19:14:21 UTC
From: bobw@col.hp.com
Message-ID: <1992Apr28.191421.15379@col.hp.com>
Source record: 290510

I have a TH 77A and like it just fine. One person's opinion.

Be advised:

* The 77 is definitely being phased out and Kenwood has introduced the
TH-78A.

* The 77 was sold for as low as $374 at Dayton. A real bargain.
It you want a 77 check your favorite dealer quickly.

1589. QRP Kits - MFJ vs. A&A - comments?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 19:37:19 UTC
From: FLEM%athena@leia.polaroid.COM
Message-ID: <9204281937.AA21162@ucsd.edu>
Source record: 290511

There are two other QRP companys to also consider. They are:
Oak Hill Research
20879 Madison St.
Big Rapids, Mich 49307
616 796-0920
FAX 796-6633

624 Kits
171 Springlake Rd
Spartanburg, SC 29302
803-583-1304 >Pat does this as a sideline-Call eves and W.E.

I ordered a 'Gary Breed' xcvr kit from 624 after I found an error in the
'92 Handbook PCB layout. (Pin 11 of the LM324 wasn't grounded. I bet that
layout wasn't tested before given to the ARRL. I'm sure A&A Eng must have
corrected it by now...)But it was the $50 differance between A&A and 624
that made me decide in favor of 624. (I think A&A includes an enclosure)
A friend of mine (AJ2X) just completed an Oak Hill 30M D.C. xcvr
that's going on the air this weekend. He's happy with unit and the assistance
Oak Hill has offered.
Both of the above mentioned companys offer kits and small (aren't
they all?) parts for the scratch builder.

Sort of a newbie question.

I passed my nocode a while ago, and while I'm waiting for my
ticket to arrive I've been listening to local 2m and 70cm repeaters on
my Alinco 570-T from my car.

I've been using a Larsen magmount antenna, and I'm having
problems with it. It worked fine until one day I left it on the car in
the rain. I took it apart and left it indoors for 3 days, after which
it seemed to work briefly - that is until I reached a small rain
storm, upon which the static level rose enormously and it could no
longer be used.

I've tried drying it out again, and now I can get some strong
70cm repeaters, but no 2m capability at all.

This antenna consists of a center-loaded whip, a base coil(?),
and magnetic base with cable.

Questions:

* Do I just have a bum whip? Can I fix it or should I try to get
it replaced?

* What can I do to prevent a repeat?

* Is there another brand of antenna I should be looking at?

thanks,
Peter Trei

> Hello Bob,
>
> Thanks for your recent postings on the DSP based TNC. Very interesting! I wanted to buy one about a year ago and it was not quite ready (That is what
> AEA told me anyway...) In anycase, it seems that I need to start saving my pennies for one now!
>
> Do you have a feeling of how much the "experimenter's kit" will cost (a rough estimate is fine) ?
>

The experimenter's kit will be the cost of the manual & floppies. I haven't asked them what they are doing with it. The assembler is one that I wrote. I think the assembler from Motorola is horribly expensive even if it is nice. Mine is a two pass assembler and I will give it away with the C source with this package. The package as I now envision it will be the technical manual, schematics, source for some DSP functions, programming model descriptions for both the host and DSP, a debugger for the 64180, a debugger for the DSP56001, stuff like that. This will not happen overnight and is about as large an undertaking as the dual portr modem code which I wrote in one month but I didn't have to write a manual to go along with it. I am NOT a good writer, barely able to either speak or write English and I am very self conscious about it ;-). This will involve several people at AEA and myself. More will follow this. AEA and I are working out a game plan now.

Bob

>
> As an owner of a DSP-12, made by Bob's hated (my deduction from the
> tone of his remarks) rival, L. L. Grace I must say something in their
> favor.
>

The only negative thing I wrote in my note was a response to notes, phone calls, letters, accusations that (1) the DSP2232 was incapable of doing dual port modems and (2) that I was incapable of writing them. I said nothing negative about the DSP-12 and I said nothing negative about Brooks. I said and I quote "I have received numerous phone calls and notes saying that the manufacturer of the DSP-12, LL Grace, has gone far and wide telling people that the DSP2232" etc. etc. I think gave my comment on this. I believe I called it hogwash. It is and I stand by that remark. For your information, I do NOT get a royalty of ANY variety from AEA. You may call them yourself and ask if you so choose. On the other hand, Brooks gets about $150 per box after expenses on the DSP-12. Am I doing this out of the goodness of my heart? Yes and no. The stuff for the amateur markets was done over the last two years. Had I been paid, it would have been done a lot sooner. Will I make money? I hope so, on a modem I have designed for commercial HF use,and not legal AT THIS TIME for amateur radio. Do Brooks and I hate each other? The answer is no. If you do not believe me, call Brooks and ask him. His number (being a friend of mine, I know it by heart) is (609)-751-2385. If you want to call the president of AEA and ask him if I get royalties on the DSP-2232, his name is Rod Procter, (206)-774-5554. For three years I have worked on this for the good of amateur radio and with hopes that one day it would be a success in commercial HF markets.

I demand an apology.

Bob McGwier

1595. SWR Foldback Circuits

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-28 20:42:17 UTC
From: perry@hpfcmgw.FC.HP.COM
Message-ID: <19530037@hpfcmgw.FC.HP.COM>
Source record: 290517

I was playing with my Kenwood 440's SWR foldback circuit last weekend, and seek comments from the wisdom of the Net.

First, a summary for those that don't know how SWR foldback works:

The idea is to reduce transmitter power as SWR increases. This is in most modern radios, making them virtually indestructable.

In the TS440, there is a directional coupler that drives a transistor that pulls the ALC line negative, shutting down the drive to the final amplifier. That's the "reflected power" side of the coupler. The "forward" power side is also sent through a transistor and shuts down the drive as it approaches 100 watts. This is way cool, the amount of stuff that is fed back into the transmitter ALC. There's even a pin on the back of the 440 for a linear amplifier. Some people use this to get <100 watts for SSB without futzing with the MIC Gain.

The specification for the TS440 is <1.5 SWR at 100 watts. One of the many equations for SWR is: SWR = (1+p)/(1-p), where p (rho) is the reflection coefficient. Solving for p, p = (SWR-1)/(SWR+1), or .20.

What p really is - the standing waves vary from a maximum of 1+p to a minimum of 1-p - that's the standing wave ratio (SWR). So, the voltage (VSWR) of 1.5 at 100 watts means a maximum voltage of

E = sqrt(P*R) * (1+p)

Or about 84.85 volts. (probably 100 volt finals)

The next step is to plot the value of maximum allowable SWR vs various forward power levels. (I was doing this with a Bird which measures forward and reflected power, so I plotted forward vs reflected numbers for a constant 84.85 volts.)

The results are amazing. For example, for 50 watts forward, the TS440 should allow (1+p) = 85/50, or SWR = (1+.7)/(1-.7) = 5.67.

However, the TS440 folds back to about 10 watts at this kind of SWR. I suspect that I could change the foldback circuit slightly, tuning the base and collector resistors so that the maximum RF voltage never exceeds 85 volts, but that would depend on the beta of the transistor I use.

Has anyone tried something like this ? Is there something wrong with my equations ?

From: fms@sw.stratus.com
Message-ID: <2576@transfer.stratus.com>
Source record: 290518

Hi, folks!

We installed a Yaesu FT-5200 in my '88 Honda Civic Wagon this past winter, and I started getting ignition buzzing on the receive side across weaker repeaters, on both the 2m and 440MHz sides of the rig. So far we have replaced the spark plugs, plug wires, distributor cap & rotor with better-shielded versions, and it does not seem to have made a difference. Next on our list is to verify that the radio itself is properly grounded, but I figured as long as I was in front of my terminal thinking about it, I'd pose the following to the net: Is there anybody out there who has successfully de-RFI'd a Honda? I ask in general terms at least partly because my husband's Nissan does _not_ generate receiver RFI, but whenever he drives near a Honda (NOT JUST MINE), his radio picks up ignition noise from the Honda. So I suspect that simply verifying the radio ground will also not help me, and that it's something inherent to the car itself. (I will also be putting the question to my auto mechanic, who apparently has a line into a Honda tech network of some sort).

Honda tales of RFI woe welcome too -- misery loves company... :-) :-)

Thanks, all!

SB QST ARL ARLB036
ARLB036 FCC enforcement news

The FCC has increased the authority of its various bureaus,
including the Private Radio Bureau, to levy fines for rules
infractions. The bureaus now may levy such fines in amounts up to
20,000 dollars on their own authority. On August 1, 1991, the
Commission issued new policy guidelines authorizing greatly
increased amounts for fines, but the bureaus were limited by much
lower ceilings of authority. Large fines had to be authorized by
the commissioners themselves. The average FCC monetary fine is
about 8,000 dollars.

SB QST ARL ARLB037
ARLB037 FCC Levies Fines

The FCC has begun what is expected to be a wave of enforcement
actions. Several hundred cases are reported to have been on hold
awaiting the granting of authority to the Commission's various
bureaus to levy higher monetary fines. That authority, granted
April 15, raised the maximum fine that can be levied without
approval by the Commissioners themselves to 20,000 dollars. Thus
far only a handful of actions have involved amateurs.

On April 24, 1992, the FCC issued three Notices of Apparent
Liability affecting Amateur Radio. David Plourde, N1IZR, a
Technician class licensee in Lewiston, Maine, was issued an NAL for
10,000 dollars, for using non-type accepted equipment to transmit in
the Citizen's Band. Also on April 24, a non-amateur in Tampa,
Florida, was issued an 8,000 dollar NAL for transmitting on the
Amateur 40-meter band.

On the same day Donald Bishop, N0EA, an Amateur Extra Class
licensee, was issued an NAL for 10,000 dollars for transmitting
from a mobile installation on frequencies near 7420 and 15050 kHz.

Finally, also on April 24, the Private Radio Bureau's Special
Services Division issued the first Order to Show Cause and
Suspension Order to amateurs in several years as the result of an
investigation into volunteer examiner practices. Charles P. Pascal,
WB6CIY, and Sandra V. Crane, N6TFO, both Amateur Extra Class
licensees, have been ordered to show cause why their Amateur
operator licenses should not be suspended and their station licenses
revoked.

These orders are the result of an FCC probe into volunteer
examinations given in August and September, 1991 by Pascal and
```

Crane.

SB DX ARL ARLD021
ARLD021 DX news

Thanks to Tedd, KB8NW, the Ohio/Penn Dx Packet Cluster Network, Bob,
W5KNE, and QRZ DX for the following DX information.

MALAWI, 7Q. Paul, 7Q7BW, and Christine, 7Q7BX, have been very active
on the Afikaaner net on 21355 kHz. Look for them between 1900 and
2000z daily. 7Q7BX has also been heard on 28480 kHz around 1220z.
QSL to N5MHZ.

On CW, look for 7Q7XX on 21025 kHz at 1900z and 14011 kHz at 0520z.
7Q7RM is on 28021 kHz at around 2020z. QSLs for 7Q7RM go to G0IAS.

GHANA, 9G. Europeans have reported working 9G3CC on 10 and 15 meter
CW and SSB. Packet Cluster spots show activity on 21020 and 21235
kHz around 1200z. QSL via F6FNU.

OMAN, A4. Look for A41KB on 14222 kHz at 0238z, A47RS on 21317 kHz
at 1600z, A45ZX on 14083 kHz RTTY at 0120z, and A45ZZ on 18140 kHz
between 0200 and 0430z.

JORDON, JY. Joe, JY9ZK, has been a regular on the nets. Look for
him around 0000z on the 14226 net and sometimes around 0400z on the
14236 and 14256 nets. QSLs go to KA5ZMK.

WAKE ISLANDS, KH9. Remember to look for Bill, KA3HMS, until April
25 on 10 and 15 meters.

SOUTHERN SUDAN, ST0. John, PA3CXC, is expected to be active until
April 28 signing /ST0. He may try to travel to Uganda on business
and sign 5X5CW.

MALI, TZ. Larry, TZ6ZZ, has been active on 28503 kHz working lots
of stateside and VKs from 0130 until around 0300z. jjS via N0BLD.
```

ITU GENEVA. Gian, I1RBJ, will be active May 1, 2 and 3 using the special callsign 4U7ITU.

BANGLADESH, S2. Team S2/HA5BUS was unable to obtain an extension of their operating permit. Their next stop may be Malaysia.

IT'S IN THE MAIL. QSLs for the January Navassa DXpedition are now being received. W4FRU isiling S21NQ cards and W5BOS is busy with VK9XM QSL chores.

WARC BAND PACKET CLUSTER SPOTS.

This month, my QST arrived late. Not just at my house, but at the newstand (at HRO) as well. It finally arrived on Monday, the day _after_ Dayton, with the front inside page ad showing all the new Kenwood rigs, the ones which were "introduced" over the weekend.

On the same day (the Monday after Dayton), HRO also had their new catalogue out, also with all the "new" rigs from Icom and Kenwood.

Being suspicious that I am, I'm forced to wonder...

Was QST deliberately held back at the request of an advertiser?

It seems that the HRO catalogue definately was, perhaps in accordance with a nondisclosure agreement. Oh well, the late QST just got me thinking...

|> de Skip, NT1G

I recently bought and completed the Oak Hills 20mtr qrp transceiver and
have been very happy with it. Priced at $149 and it's complete with
case, etc.

If you are going to construct this kit, let me know and i'll email you
some hints and kinks that may help you do a better job. this kit is
for the experienced builder although one experienced with soldering
techniques and could take their time and carefully think ahead could
do this with little or no trouble.

i worked a u4 and yl2 on 20mtr using a 240ft longwire up 15ft running
2w out. also did 22 states/countries during the qrp test a few
weekends ago (4hrs op time). the rig is cute, small, and nice for the price.
there is a review in the latest QST on the 40mtr version. from the
photograph i believe that my technique for routing jumpers is both neater
and better. in fact, by reordering some of the jumpers, i shortened them
and made the final product look better, but i've been building heathkit
stuff for 30 years and homebrew about 20 yrs. my first kit was an Ameco

AT-1. if you know that one, then you're older than dirt.

just my $0.02 worth. i am not paid by oak hills or in any form associated with them.

anyone who has the mfj 9020 rig and/or the a&a rig give us some feedback on them. i have heard that the mfj9020 really has only a 4 pole filter instead of 8 as advertised. they count the 4 crystals and 4 capacitors together as 8, and i don't think that really is a 8 pole filter. do you?

p.s. how many ssb kits do YOU know about? can you say appliance operator? i knew you could..... :-) :-) (flame suit on - fire extinguisher at the ready) BEAM ME UP SCOTTIE!

I have a 1991 Honda Civic DX and operate an ICOM 02-AT handitalkie with a magmount quarter wave as my mobile. Didn't have one bit of ignition noise on the radio for over eight months until I took the car in for 16,000 service which included a tuneup. Now I have ignition noise!! You would think that Honda parts installed at a Honda dealership would leave the car as noisefree as the factory made it but there is now noise which is noticeable. Since it does not affect the regular car radio, I was told that that is proof that my handitalkie must be defective!!!!

Otherwise the car runs good.

Good luck.

In rec.radio.amateur.misc, dnewkirk%arrlhq.UUCP@uhasun.hartford.edu (Dave Newkirk) writes:

>In rec.radio.amateur.misc, I wrote:

>>Above 1 is RF performance (something that seems to be all-but-forgotten
>>in the current generation of radios.)

>How can you say this? The RF performance of most mid- and
>high-end MF/HF ham radios of current manufacture is excellent.
>The radios (Collins S lines, R-390/As, Heath SB-300/400s, etc)
>usually invoked as embodying standard-of-comparision performance
>are soundly beaten by most mid- and high-end radios in terms of
>two-tone IMD receiver dynamic range (at the 20-kHz spacing used
>in the ARRL Lab)

But most interfering signals are not within 20 kHz. The older rigs
have narrow tunable filters in the front end, so their dynamic range
is MUCH better than modern rigs greater than 1 or 2 hundred kHz
from the signal frequency. When the Drake TR-7 first came out,
the manufacturer even showed a graph of TOI versus offset frequency
for the TR4 and TR7. As I recall, the TR-7 was 10 or 15 dB better
close in, but much worse far away.

>blocking receiver dynamic range

This was/is often effectively limited by phase noise in synthesized
transceivers. I've heard that the newest generation radios are better,
but I bet still not as good as the old VFO/PTO-tuned rigs. (Especially
far from the receive frequency)

>receiver minimum discernible signal

I have never liked this term, since the name implies a subjective
measurement. (Different operators can discern signals with different
signal/noise ratios.) In any case, the sensitivity of HF communications
receivers has been better than atmospheric noise levels since the 50's.

>short- and long-term frequency stability

For sure, this is one area where a synthesized radio should excel.
However, many modern radio designs do not pay much attention to this,
(uncompensated reference oscillators), and only achieve 10 or 20 ppm
accuracy, not much better than the best of the old tube rigs.

>frequency calibration accuracy and resettability

See above.

>AGC performance

The Drake 2B had the best AGC performance of any radio I ever owned.
You could run full break-in with the receiver unmuted and set to "fast"
AGC. All you heard was the transmitted signal, with no popping or
clicking or excessively loud "sidetone".

>frequency agility
>frequency coverage

I yield! These are the big advantages of synthesized radios.

>transmitter spectral purity

If you mean spurious mixer products, then I agree. If you mean broadband
phase AND AMPLITUDE noise, then the old tube rigs win hands down. This is
why Drake and Collins radios are so popular on Field Day.

>transmitter output-power control

Not sure what you mean. Most older rigs had drive level controls. Maybe
the new ones work better...

>features-per-dollar value when costs are adjusted for inflation
>between "then" and "now"

Correct. If you want bells and whistles, then a Collins
S-line is not for you.

...

>Older radios may have cleaner LO chains, but their mixers usually
>crunch sooner. Is death better by knife or blunt instrument?)

They crunch sooner only near the operating frequency. If your strong
signals are only close by (a DX pileup, for example) then the modern
rig is superior. But there are lots of strong broadcast and other
signals outside the ham bands which blast right through the wideband
front-end filters in most modern rigs. Broadband receive coverage
is nice, but it comes at a price.

>Transmitter IMD *may* be a horse race, ...

I agree that any of the modern rigs are plenty good enough in this
respect. Splatter problems are usually the result of improper
operation of the equipment.

>...You *can't* get better RF
>performance than today by going back in time.

I basically agree. The modern rigs have better RF performance in
some areas, the older rigs in others. My beef is that the modern rigs
should be as good or better in ALL areas. There's no technological
reason why this should not be so. Unfortunately, most hams don't know
a dBm from a DXpedition and are more impressed by features than by
performance. So the manufacturers accomodate them.

Our household has three Larson dual band antennas, two on the square Larson mag mounts, one mounted on a permanent mount on the roof of the car. These are never taken off (except for parking garages) and we've never had such a problem. The antennas are easily four years old now.

I'm not sure what the problem could be, but if you found someone else with a larson antenna you could swap whips/bases and see if you can deduce where the problem is.

>>Yeah, there are tube forever guys out there, but I suspect the majority
>>of active hams have bought a radio in the last two years and plan to buy
>>another in the next two years.

WHY BE WASTEFUL? I see no reason to throw away a perfectly good radio
just because it's a couple of years old.

Modern semiconductors have an extremely long life.
A radio is typically not showing _any_ signs of wear two years after
purchase. After ten years, it may need alignment. The thing I would
worry about is the PROM erasing itself after maybe 30 to 50 years.
Apart from that, there is nothing to wear out.

Are you the kind of person that trades in your car every 2 years in order
to get a slighly different set of gimmickry on the "new" one?
You must have money to burn...

By the way, I drive a 16-year-old car and use a 9-year-old microcomputer
regularly. These are not motivated by antique collecting; I use them
because they work well for the purpose, and there's no reason to spend
money getting something different just because it's different!

Source record: 290444

I have a 765, and have fitted the TCXO, I didn't seem to have any problem setting the thing up, but I used a freq counter with a caesium standard not WWV or rugby.

I'll take a print of your posting home tonight and try the procedure in the ICOM user and service manuals.

By the way, the 765 has seperate reference oscillators for the DDS interpolation oscillator and for the step loop + 2nd local osc. The high stab oscillator improves only the latter. Any error and drift due to the crystal osc in the DDS will remain unaffected.

Cheers David GM4ZNX

I have been "volunteered" by the local club president to sit on a committee that will obtain and present to the club information concerning radio direction finding. So, I am looking for info on transmitters, antennae, plans, and procedures for holding a foxhunt. Any info recieved would be greatly appreciated!

From: kstuart@oasys.dt.navy.mil
Message-ID: <18898@oasys.dt.navy.mil>
Source record: 290447

Chris, using a series resistor for charging from the car's electrical system is fine. If you are using AA size cells in the H/T's pack, they are probably rated for about 450 MaH. You should size the charging resistor for no more than 10 percent of that figure, or about 45 Ma, with a fully charged pack...

(14v - 7.2v)/0.045, or about 150 ohms.

size the resistor powerwise for the worst case condition (shorted output cable) for 14**2/150, or 1.3 watts. A 2-watt size will be perfect.

Don't worry about using a voltage regulator. NiCads want to be current charged anyway, so a voltage regulator is useless.

Either side of the line is ok, but actually you should put the resistor in the positive lead just in case the positive side of the output happens to contact the car's frame or grounded equipment - the resistor will prevent a catastrophe, blown fuse, etc.

NEVER! NEVER! fully discharge the NiCad pack. When the "low battery" warning on the H/T kicks in, turn it off and recharge. Actually, don't wait for the indication - recharge after each use.

[deletions]

Thanks, Zack! One day, I'll be able to be familiar with
everything in *all* of our publications (on the same day I
won't need a freezer for all those snowballs I've been saving?)

Sample two-tone: R-390A, 81 dB at 20-kHz tone spacing. Oh, dear.
But cheer up, Collins fans: the best 75S-3 tested was 7 dB
better.

I am still keeping a modest, narrowly defined horse-race open as
an idea to propose for *QST* -- perhaps as a means of
highlighting automated test equipment testing now under
development in our lab. I continue to solicit net comments on
this idea. Best tube transceiver/horse candidate probably is the
KWM-2, which, I understand, did well for us in Desert Storm...

At the last crew change (early March) Sergei U5MIR came down, but two
new cosmonauts are still up there, U8MIR and U9MIR. One of the local
hams worked them both last Sunday at 5:30 am. They have a packet
bbs running on 145.55, which they leave up for amateurs to use, and
will also do simplex voice on the frequency if they have the time and
feel like talking...

Good Luck!

Harry-

Our club uses a very nice SEARS 5KW generator that is somewhat compact and
relatively quiet. It does a very nice job with two stations, and doesn't use
excessive amounts of fuel, and is easy to operate.

Steve Hufford, KA8EYM

1636. Re: Request for info - Alinco DJ580T

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-29 15:44:57 UTC
From: dsiler@col.hp.com
Message-ID: <1992Apr29.154457.18444@col.hp.com>
Source record: 290460

I received my DJ580T several weeks ago and am very happy with the unit. The mods for extended receive (e.g. 110-172 on 2m) and transmit were easily done (cut 2 wires) and the "dual scanning" capability is very nice. This is truly two radios in one --- you can be scanning or transmitting on 2m while scanning on 70cm and vice versa. If there are two signals coming in at the same time on both bands, they are simultaneously broadcast through the speaker. If you don't like the memory allocation (20 slots on each band) you can easily change the configuration.

Last weekend I was standing on an airport runway monitoring the field frequency to see what kind of arrival progress other members of our group were making. The DJ580T received aircraft just as well as a Realistic scanner (5 times as big) being used by another member of our group. Impressive!

I recently did a lot of cross-country driving and the DJ580T helped eliminate the boredom, due to the wide variety of signal ranges (including cellular on 880-890) that it can receive. Just for grins one night I turned the back lighting on and scanned both bands continuously to see how long it would take to run the battery down into warning mode --- it took a little over 2 hours which I thought was very good considering its size and the amount of work it was doing.

A big factor in my decision is the informal support for the DJ580T that has been emerging on Internet. I have an improved manual written by a generous netter that really helped me understand the vast array of features.

In article <6lgv8xp@rpi.edu> abelsm@aix.rpi.edu (Mike Abelson) writes:
>A friend mentioned to me that Icom is 'supposedly' manufacturing the
>Radio Shack 2-meter handheld for Tandy.

Speaking of the Radio Shack 2-meter HT, I was in a local Radio Shack last week, and while paying for my purchase, I asked the person behind the counter if he had one of the new 2-meter HT's in the store.

He replied, "No, we can't keep them in the store."

I replied, "These must be pretty popular items."

He went on to explain that the reason he couldn't keep them in the store wasn't demand, but that he couldn't get any shipped from the warehouse unless he had pre-paid orders from customers.

I wanted to make sure I understood what I'd just heard, so I said, "So if I pay the full amount now, you will order me one, and that's the only way I can get one."

He replied that that was correct.

When I (delicately) pointed out that there was an HRO not 30 minutes drive from where we were standing, he replied with a sigh that he was aware of that fact.

I thanked him for his time, and left.

Has anyone else had a similar experience?

73,

Marco

1638. DSP2232, AEA, DSP12, and me

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-29 16:39:46 UTC
From: n4hy@idacrd.UUCP
Message-ID: <1292@idacrd.UUCP>
Source record: 290462
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Howdy:

I have finally gotten a belly full of people doing what the gentleman did to me yesterday and to which I responded. I am sending a long statement. It is not a flame, however. You may have no interest in it whatsoever, and I encourage you to hit the n key now if you are uninterested in my personal affairs, in AMSAT, AEA, DSP, LL Grace, etc. He has written me a very nice note, and I appreciate it. He is quite correct that I should state exactly where I fit in all this. I will now.

AEA has, through a corporation set up in New Jersey to handle the DSP-2232, the Paccomm PSK-1, DOVE hardware for AMSAT, etc. paid to me a grand total of a whopping $16,000 for expenses on 3 years work on this box. I can assure you that has not even remotely covered the costs to myself. Not even close. Not anywhere near close. I do not even own the DSP2232 I am writing code on. I wrote Quiktrak. I gave it to AMSAT for four versions. Before Antonio wrote Instantrak, it was the single largest source of revenue for AMSAT, raising hundreds of thousands of dollars for AMSAT and they have never paid me a dime for it. AEA owns the hardware and software in the DSP2232 and will not pay me a nickel in royalties on ANY of it. In return for these, I get to do things for AMSAT and in amateur radio that people only dream about doing. I get to go stand on the gantry of launch vehicles, and work on space hardware that many would give half a lifetime to work on. For not receiving royalties on the AEA hardware, I get to keep all my software SOURCE and AEA cannot sell it or show it and that ladies and gentlemen is worth a bundle. I get AEA to loan me equipment for my personal use that I could never remotely hope to afford. I get the benefit of learning an immense amount of stuff that has been very helpful to my day job and had experiences that I have applied to it and for which I have received many accolades at work. I have received compensation that to me is irreplacable. I am not a saint however. I will write modems for commercial use and for that AEA will pay a bundle. I also get the right to brag as far and as wide as I want to about my achievements. If AEA had paid what I was worth in doing this, none of you could remotely ever dream of affording this box. I will not brag about the quality of the modems done for the final hardware (that hardware upgrade kit many of you got is what I am talking about) versus others. I'll let word of mouth from people who own the various boxes tell the tale as those of you get the new ROM from AEA over the next month. I make the following pledge. If you find a modem ANYWHERE that outperforms the ones in this box, I will not stop working on them until they are the best or find out why they cannot be the best because of the comprimises we made in making this box do `everything' and tell you about it. The gentlemen yesterday told what Brooks (LL Grace) did for his customers. I apologize for this taking so long, but this is being done through a company with real people working for it, and many things on their

platter, and it is taking them longer to respond than I would have liked and that is partially my fault. Because it is being done via a commercial company, you will not get the experimenter's package with schematics, floppies, programming models, assembler's, debuggers, for free. They will have costs associated with making these available in a professional form, and in a form they will be proud to have their name on and one that they can easily support for years to come. That is what you get (and pay for) when you buy from a bigger company versus a garage operation. They pay full time staff to support you as best they can. We all know that is not perfect but it is better for most people than getting an answering machine while the guy is at his day job and hoping he will call back that night. I cannot believe what Brooks has been able to put together in the DSP-12 working in his garage with help from others he got all on his own. I congratulate him on it and wish him well. It is a great personal achievement for him and his team. His work on this and on the Kansas City Tracker have made sure that he will go down as one of the best technical innovators in amateur radio. I will stand by my feelings that his temporary time at the top on these DSP multimodes is over. For those of you who insist on programming the host processor, the DSP processor, and want to spend time on that (all couple of dozen of you) it is the right way to go for you if you program C or assembler on a PC. It has a V40 in it, and he has made it easily accessible to you. That is great. He is definitely serving a niche that AEA is not, and maybe will not support. I will probably buy one myself and play with it since I am pretty good C and assembler programmer myself (see reference to Quiktrak above). I have written code for the V40, it now flies in space as the command and control system on four Microsats, and so I am pretty familiar with it. It is not the best IO processor however.
It has some real drawbacks for doing this kind of work. I am sure that Brooks will be glad to impress you with how he has had to struggle to get it to do all the jobs it needed to do and (say) keep up with 9600 bps sustained from UO-22. On the other hand, from the first day I got the DSP2232 host code from N6IA, it would breeze through 19200 bps. The 64180 is simply faster at handling byte oriented IO than the V40. PERIOD. DMA (which only the DSP2232 has) on the 8530 in the final version has sped it up even more, End discussion. To add insult to injury on the timing side, the 64180 is clocked faster in the DSP-2232 than the V40 is in Brooks box and it is eight bit instructions rather than having an eight bit data space and doing two fetches to get the 16 bit instructions! It all adds up and the bottom line is that for doing the IO job these boxes want done, the 64180 implementation is hands down faster than the V40 implementation in the DSP-12. It depends on what you want!
Steve is hacking around now to support sustained 38400 so that we can easily support full quality, 256 shades of grey as many pixels per inch as are in the original signal, SSTV, WEFAX, etc. The drawbacks are that this processor is NOT widely used to say the least in PC's and many have given up programming the Z80, even if it does have fancy bank switching for a big address space. In my opinion it is STILL the right choice for that box, especially given the number of man years that went before it on the TNC's and the PK-232. Steve Stuart is simply the best I have ever seen at writing that stuff and AEA has chosen to make the most of that asset. On the other end of the system however, there is no comprimise with you the adventurer. You will be given a complete access to the DSP processor. You will be told all that you need

to know, and given examples of how to do it, and a technical manual to help hold your hand, and it is my hope AEA will make the schematics available. The access is already built into the existing system and will only get better. On the host side for those of you who still remember how to program a Z80, and who want to learn the weird and wonderful ways of handling the segmented address space and write your own applications, we are putting together a debugger for your pleasure (I really am a sadist at heart ;-).

This weird relationship has cost AEA something as well. They geared up the advertisements before it was ready and many pressures stopped me from finishing. It is now finished and the testing, perfecting, and bug removal will continue. Because of the strange nature of doing this kind of stuff in the amateur radio market, where the real costs associated with doing something like this are never seen or passed on to the customer (since they are not charged, this applies both to Brooks and partially to AEA in this case), you the purchaser will find stuff you don't like because there is no way you could pay for the box if it went through the million dollar testing program to find out the stuff you complain about. The bond of trust you get when you buy from LL Grace or AEA in this kind of strange market (I know no other like it), is that they make upgrades to you for `free.' That is, the costs of doing the upgrade to you are what you pay and not for the time spent on doing the fixes. In the normal commercial world, the testing costs as much or more than the bloody development. I apologize to AEA publicly for the six month delay in which they sold without benefit of the real modems designed for the box as it was being shipped (new analog front end, no dual ports, etc.). That is done with and behind us.

As to the gentleman's statement that Brooks and I are hated enemies, that is hogwash. Brooks and I have had legitimate differences. We designed the DSP2232 together with KA2MOV. Before it was close to market, he went on his own and did the DSP-12. They have both arrived at market at about the same time. Both serve different clients and the overlap in their markets is actually quite small. AEA will service primarily the HF market, and will serve all the gee whiz folks who want the FAX's, etc. Brooks will serve the experimenter who wants to get at all pieces of the box easily and is only comfortable dealing with PC like stuff. Both serve the satellite markets amply well, Brooks and I both `grew up' there in ham radio. Because Brooks did the DSP-12 while I was still humping on a product we did together with AEA, I was extremely angry. It eroded the trust between AEA and me. Now with hindsight being 20/20, on the part of Brooks, myself, and AEA, finding out we have different goals, mostly different markets, that is all behind us and we are marching to a positive tune rather than stabbing each other in the back. At the time, because I was so heavily weighted down during the late part of the year 1990 and the first few months of 1991 and then the last few months of 1991 with what I like to call world events, I felt extremely guily that he had beat AEA to market. They were angry and in turn, I was angry beyond repair. I believe legitimately so, you may not. I want that to be behind me now, and I am looking only toward the future.

That is the end of my free flowing diatribe. The bottom line is that I have misled people concerning this box by saying that getting less than

N dollars per box is no incentive to go faster (when N is actually a negative number, having cost me money), because I did not want to hear people telling me what a fool I was but I am tired of the damn holier than thoughs and I will tolerate it no longer. I strongly believe the DSP2232 is the best existing DSP system. Time and you will tell. I will continue to brag freely here and elsewhere so that you know what is in it and can share my excitement in these achievements which I sincerely hope you enjoy using.

Have fun with the DSP2232 or the DSP12. Decide which is right for you and go get it. DSP is the only affordable way for amateurs to do the myriad of specialty modes we have available to us. The price tag seems high. I want you to think about what it is you are getting for that. You are getting a box that does as much as boxes and modems totalling tens of thousands of dollars, AND, if a new one comes along, we change a ROM and you've got it as well. A new satellite modem? (such as RSM on AO-21) no problem, here is a new file, upload it to your box and go on. Yes, I am as excited now as I was when we started all this mess with W3IWI. It can only get better.

Bob

> 20 milli-amps. Calculated by:
>
> (13.8 - 7.3) volts / 328 ohms = .02 amps

Keep in mind that overcharging NiCds is a no-no; it causes the voltage depression on the subsequent discharge cycle that it commonly (and mistakenly) attributed to "memory." I would not recommend that the pack be left on a 20 mA charge for an extended period of time, even though this is getting down into the "trickle charge" range, without some means (such as monitoring the voltage of the pack) to detect the onset of overcharge.
>
> Is this all there is to it? It seems too simple. Should I consider dropping
> the voltage from 13.8 volts to reduce the current when the pack is fully

B.G. Micro (Dallas; 214-271-5546) is currently offering EPSON EG-7004S-AR flat panel LCD graphic displays for $19.95. I bought two. They look PERFECT for making a portable packet terminal (640 x 200 dot-matrix in about a 11" x 6" size, total current draw about 20 milliamperes).

They came with a 27-page "manual" which is full of timing and electrical specifications, but it would sure save me a bunch of work if someone who has already interfaced one of these could give me a few suggestions!

Will anyone admit to having done such an interface?

[Excerpted from Monitoring Times, May 1991, "The Scanning Report," by Bob Kay.]

SCANNER LAWS

Scanning in the nineties is more than simply turning on your scanner and listening to the action. Scanning is quickly becoming entangled in legal complications. The Electronic Communications Privacy Act of 1986 (ECPA) is a prime example. As we all know, the law prohibits third party monitoring of cellular phones. We all know the law is ridiculous, but that really isn't the issue. The ECPA is important because it restricts our access to the airways.

Think about that for moment. For the first time in history, the government has restricted your access to a specific group of frequencies.

The issue becomes laughable when you realize that it's perfectly acceptible to routinely monitor the Secret Service - the agency that protects the President. It's also legal to monitor the frequencies that belong to the Drug Enforcement Agency(DEA). We can't divulge what we hear, but we can legally listen. On the other hand, the ECPA has made it illegal to listen to the cellular bands. You can be prosecuted for simply admitting to monitoring between 870.00 and 890.00 MHz.

Mobile scanning is another segment of our hobby that is controlled by a variety of restrictive laws. There are a number of states that do not allow scanner radios in vehicles. In most instances, a ham radio license is all that's needed to prove your intentions were not criminal. But a ham license won't protect you in every state. Ham radio buffs with mobile scanning rigs have been prosecuted. At this writing, scanning from a vehicle is banned in Florida, Indiana, Kentucky, Michigan, Minnesota and New York.

What You Can Do

Write a letter to your Congressman or Senator. If you don't know the address, call 202-224-3121 and ask. Your letter should state that you are opposed to any new legislation that would further restrict your right to monitor the airways. Simply pretend you're writing a letter to a friend. Don't worry about using fancy paper or using a specific format. A note pad and pen will do.

How important is your letter? To a Congressman or Senator, your letter represents approximately 1000 votes - a figure derived from your

personal contacts with friends and family. Scanner hobbyists in New Jersey organized a letter writing campaign that proved highly successful. Scanner prohibition in New Jersey was recently struct down and replaced with a less restrictive law.

Sure, I know what you're thinking. Let somebody else do it, you don't have the time. And that's exactly where we fail. As scanner hobbyists, we are not accustomed to joining together as a group. Why? Because we usually scan alone, in the privacy of our homes. Scanner buffs are natural loners. But if we intend to preserve our hobby, we must let out political leaders know who we are.

Call to Arms

The Senate will shortly be voting on legislation that would prohibit the manufacture of radio scanners that pick up 800 Mhz cellular frequencies. The proposal, already passed by the House, would ban the production of all scanners capable of intercepting cellular calls as well as those that could readily be altered to do so.

If the cellular bands are eliminated, it's only a matter of time before the public service bands are removed from scanner radios as well. Scanner radios will continue to be sold, but gone will be the days of listening to police, fire, ambulance and government agencies. If you're worried about loosing your right to monitor the airways and the investment in your equipment - you had better write a letter.

Scanning clubs can be found in nearly every state. Here are a few examples of how club managers can encourage members to write a letter: 1) Offer reduced membership rates to letter writers. To qualify for the special rate, members would submit a copy of their letter. 2) Give away a prize. To enter the drawing, members would submit a copy of their letter. 3) Invite your Congressman or Senator to a club meeting. Then explain why the club is oppsed to new anti-scanning laws.

In today's high tech society, it's difficult to keep pace with our rapidl;y evolving technology. Restrictive scanner laws are testimony to the fact that our legislators in Washington need to be educated. They simply don't understand that restrictive scanner laws cannot guarantee privacy. It's up to you and I to educate Congressmen and Senators. We can do that by simply writing a letter -- a 29 cent letter.

[END]

==========

[From Monitoring Times, November 1991, "Closing Comments."]

ALERT! CALL TO ACTION!

Write, fax or telegram your state's two senators immediately opposing Section 9 of the FCC Funding Bill. Do not photocopy the sample letter below, but retype any of its contents (in your own words if possible) without delay! Get other radio hobbyists and BBS subscribers to do the same -- remember, one letter represents 1000 votes in the minds of your legislators!

==========

(Date)

The Honorable Senator _____
U.S. Senate
Washington, DC 20510

Dear Senator _____:

I urge you to oppose Section 9 of the Federal Communications Commission Authorisation Act, Interception of Cellular Tellecommunications, prohibiting the manufacture of scanning radio receivers which include cellular telephone frequencies. The FCC has gone on record opposing the blocking of cellular frequencies in scanners.

While worded to appear to protect individual privacy, Section 9 puts that responsibility on the general public, not on the sender where it belongs. It asks the listener to plug his ears rather than suggests the sender safeguard his message.

Millions of radio scanners already receive cellular telephones; even after passage of the amendment, tunable receivers, test equipment, TV sets, VCRs and frequency converters will still legally tune cellular frequencies. Even scanners with cellular frequencies ommitted will readily receive, without modification, cellular phone calls using the image method.

The courts have continuously held -- virtually without reception -- that radio transmissions cannot reasonably expect privacy, and the laws of Congress will not change the laws of physics.

A ban on cellular-capable scanners would deprive millions of two-way licensees an inexpensive and reliable way to monitor interference to the cellular services which may be generated by their systems.

Such a ban would also deprive Part 15 users and Experimental Class licensees access to inexpensive, readily-availible receiving equipment for their legitimate services.

The term "cellular" is generic, referring not only to mobile telephones but any radio system which utilizes this technology. The wording of Section 9 would create a regulatory nightmare for Congress to resolve.

Section 9 establishes a dangerous precedent by encouraging licensees to demand equal protection by frequency censorship, inviting abuses of the spectrum to go unmonitored and unreported by conscionable listeners.

Section 9 is unnecessary in any case; the cellular industry has publically stated their intent to digitize telephone calls in the near future, making them unintelligible to uninvited intrudors. Scrambling is already availible to customers who request that measure of privacy.

Thank you for opposing this commercially serving and poorly composed section of the FCC Funding Bill.

Sincerely,

(Your signature and address)

David:
Your point is well taken but the electrolytic capacitors may not agree with it. An electrolytic cap that has been sitting in its original box for 10 or more years will probably have dried out and be *very* leaky. One that has been in use over that time period should not leak at all and work as well as the day it was made.

I would turn on the power switch of a "New-Old" piece of equipment with great trepidation. A power supply with leaky filter caps could get pretty hot and smokey when the big switch is turned on!

I agree with the original request: articles on this in QST would be of great interest.

Speaking of the Radio Shack 2-meter HT, I was in a local Radio Shack
last week, and while paying for my purchase, I asked the person behind
the counter if he had one of the new 2-meter HT's in the store.

He went on to explain that the reason he couldn't keep them in the
store wasn't demand, but that he couldn't get any shipped from the
warehouse unless he had pre-paid orders from customers.

I thanked him for his time, and left.

Has anyone else had a similar experience?

Nope. The RS across the street used to stock them on the shelf
but they didn't stay there very long. I finally resorted to
leaving work one morning shortly after the delivery truck was
scheduled to arrive..... NUTS! Back ordered again.

You must have run into a store manager's policy, not RS policy.

I was eventually wooed by the lure of dual band operation and
got an Icom W2A. Aside from a somewhat delicate battery attachment,
it's one heck of a radio.

... rest deleted ...

I'm confused. When the ECPA was passed in 1986, I was upset and send my senator a letter. In return, he sent a letter saying how much he appreciated my views and included a copy of the ECPA. Upon reading the copy, I noticed that it is incredibly vague. It states that it is illegal to receive ANY transmission not intended for public use. This would include the Secret Service and the DEA, as well as most transmissions outside the amateur and commercial bands (aircraft, police, military, etc).

In fact, there was some discussion on the net last year about the ECPA including non-broadcast electronic communications as well, including telephone, cable TV and computer network systems and their associated equipment (e.g., cable TV descramblers, information read protected on

computer disks)

It may be illegal to read other people's Email messages. There was an article in the Washington Post last year regarding someone who was fired because they sent an Email message to a friend with derogatory comments about their boss. The company they worked for automatically recorded all outgoing Email to check for industrial espionage. The boss was given a copy of the message, which resulted in termination. As I recall, there was a suit pending claiming violation of the ECPA.

I have assumed that the only reason violations of the ECPA are going unchallenged is because the authorities are awaiting the outcome of the various court cases challenging its legality.

In any case, it would seem that the senate scanner bill means that someone out there is intent on enforcing the ECPA at the source.

I'm looking for an electrician in the Seattle/Bellevue area to do the
following types of work:

1) Trace a circuit to make sure that hot and neutral are not reversed
and that a fan is not wired with the switch the neutral lead (I could
probably do this myself, but since I need to have other stuff done
anyway...)

2) Add a 'whole house' surge supressor' and an X10 noise filter/bridge
in our panel.

3) Add a couple of outlets in different places (one of which will involve
stringing a new piece of romex in a wall).

Any referrals (negative or positive experiences welcome) would be
appreciated.

While reading article <1992Apr29.161538.0165035@locus.com>, I noticed that marcoh@lear.bos.locus.com (Mark Heroux) said the following:
>He went on to explain that the reason he couldn't keep them in the
>store wasn't demand, but that he couldn't get any shipped from the
>warehouse unless he had pre-paid orders from customers.

That's the story I've heard from some RS managers around here as well. The "story" goes that they are very popular and a rather limited production run, so the pre-order policy guarantees that they don't end up sitting in stock in the Podunk, Montana Radio Shack whereas 400 other stores have been back-ordered for the last six months...

+---------------

Here we are, hams finally start to get into DSP and all we can do is overinflate the DSP-23/DSP-2232 rivalry???! Drop it already! Hams are supposed to be in the forefront of radio, so get one or the other or design your own or SOMETHING and get moving on pushing the limits of DSP already! (The above NOT directed at McGwier or Brooks, who are clearly already doing so.)

I've heard this from two or three of the Radio Shacks in this area. There is at least one with a display HT, but it seems to be broken (can't convince it to break squelch), so I suppose it's not a surprise it hasn't sold!

Incidentally, two of the area Radio Shacks were displaying a 1 watt two-channel business band HT the other day (151 MHz area). It's new and not in the catalog.

I suppose the one your talking about is the AEA-FAX which is a
very simple demodulator supproted by a very good software package.
Depending on what monitor you have on your machine, it will do
false color, and 16 grey scale FAX maps and store them in the PCX
paintbrush format. So far, it's the best WX_FAX package I have
seen yet, but then, I haven't seen the new DSP stuff yet :-)

Oh yes, I got mine direct from the local AEA rep here in
Houston, or order direct from AEA.

Hope that helps.

I live in cookeville and also had the same problem you did. The only way you could get an HT is to prepay and they would get me one. The manager told me that every radio shack was supposed to have one but managers in other stores would hord them. The district office here I believe was in on it too. He finally stated he was going to complain to the head office and suddenly got some HT's in his store. So I think there is some funny things out there happening.
See ya later.

1666. Atlantic HF air comms (Re: Signals received on 8 MHZ)

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 08:20:04 UTC
From: torbjar@ce.chalmers.se
Message-ID: <TORBJAR.92Apr30092006@cert17.ce.chalmers.se>
Source record: 290390
Cross-posted to: rec.radio.amateur.misc,rec.aviation

[I followup to both groups mainly for the aviator having an HF receiver
but who doesn't follow rec.radio groups. Also, several lines are 96
characters long.]

Below is a condensation of frequency information for Atlantic flights
from a few KLM/SAS/SWR Route Facility Charts (RFC 1, 40, 41, 57). It is
mostly HF, with some VHF frequencies.

Also, as was pointed out, Popular Communications has a column with
loggings from readers that often include frequencies from the HF air
bands (2850-3155, 3400-3500, 4650-4750, 5450-5730, 6525-6765, 8815-9040,
10005-10100, 11175-11400, 13200-13360, 15010-15100, 17900-18030,
21850-22000, 23200-23350).

Does anyone know whether the [westbound] OTS tracks are broadcast on HF
in addition to VHF?

Also, maybe someone can provide information about routes and communication
used by eastbound flights from Europe (to the Far East).

Could be.
>
>Is there a better way to do this?
>
>-- Michael kc1qx

So you want maybe 500 mV for the PK 232. The LM386 will do this, but why not just use a LM741. Much cheaper. Or if you like one of the many improved versions. It can be run of a 12V supply by biasing the non-inverting (+) input to 6V with a couple of resistors. Use a decoupling capacitor to guard against feedback non-linearities. DC block capacitors on input and output, normal resistive negative feedback to set the gain. Put the input to the inverting input (-) by say a 10K resistor and use a 47 K or 39 K in the feedback loop. Frequency compensation can be added if you feel like it.

Even simpler, a transistor amp (common emitter), four resistors and three capacitors (2 dc block, 1 psu stabilisation). Ratio of collector and emitter resistors sets the gain.

Use a 386. Put a pot on the input and/or output.

73 Mike

1668. What the *$#%$@ is 70cm?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 09:11:37 UTC
From: simmons5275@iscsvax.uni.edu
Message-ID: <1992Apr30.041137.4243@iscsvax.uni.edu>
Source record: 290392

I am preparing to take the no-code technician licence test and I have a question for all of those vetrans out there. What are some advantages and disadvantages of 70cm handhelds versus 2m. Should I purchase one, or the other or a radio that can do both. I have heard alot about 2m and is one of the main reasons that I am getting into Amatuer (sorry if the spelling is off) radio. However, when it comes to 70cm band, I dont have the slightest clue about either the pros and cons or the type of trafic that is most frequent on that band. If there are any guru's on the net that have itchy typing fingers, all explanations, even or especially in length, are welcomed and appreciated.

1669. Re: IC-765 + CR-282, help!

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 10:16:48 UTC
From: dstock@hpqmola.sqf.hp.com
Message-ID: <16610128@hpqmola.sqf.hp.com>
Source record: 290393

Investigations last night into IC765 and CR282 TCXO yielded:

1) the instructions on page 6.2 of the SERVICE manual only work for the 765 without the high stability ocsillator. With the CR282 oscillator fitted, L45 just becomes a peaking tank as the old osc transistor is now working as a buffer. If you've moved the core in L45 much, you may now need to readjust it to peak the 30Mhz signal on it. Beware of probe capacitance affecting the tank when you do this.

2) The procedure on page 45 of the IC765 INSTRUCTION manual will work for radios with or without the CR282 oscillator fitted. Some people have had difficulty following this procedure because they expected to be tuning for a zero Hz audio tone. The IF filters for CW and SSB are all offset from the freq that would give a normal zero Hz tone, and so the selectivity would eliminate the signal you are trying to beat against. Instead the trick of beating 3 signals (BFO, WWV, and the calibrator) to allow the user to do an offset frequency comparison.
Select USB, tune to 9.999 MHz, you should now hear WWV's carrier as a ~ 1kHz audio tone. Switch on the calibrator switch under the top hatch and you should now hear a SECOND audio tone as well (also ~ 1kHZ). By rotating the "CAL" knob, you can shift these audio tones with respect to each other until they themselves beat together in your ear, a sort of wummm wummm wummm sound. Adjust until the rate of the beat cycles is zero.

When I re-did this on my 765 last night, I found that the cal knob wound up almost hard against its clockwise endstop, I'll have to watch this and see which direction the oscillator ages in, I may need to change the vlue of C136 sometime to bring adjustment within range should it go of the end of the pot.

The various Japanese transceivers don't (unlike the best professional gear) derive all their oscillators from a single standard. The 765 like many others has a whole bunch of crystal oscillators for BFO, CIO and carrier sources using different ones on different modes, and with some differences on TX and RX, Also the DDS part of the synth in the 765 has its own separate freq standard. ALL of these oscillators need to be set properly as they too affect freq accuracy in mode-dependant ways.

Hope this helps

1670. TrakSat V2.70 - DataSets posted onto net?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 10:37:36 UTC
From: kam@cs.bham.ac.uk
Message-ID: <KAM.92Apr30103736@mr-macgregor.bham.ac.uk>
Source record: 290394

I've just been looking at the above program which seems to be a reasonably good, shareware package for satellite tracking (on an IBM PC). The datasets which came along with it are fairly old, however, (nearly a year now!) and I was wondering if anyone posts updates to the net or knows of ftp-able copies on any site?

Each data set is a plain ASCII file containing standard NORAD, NASA 2-line elements. According to the documentation with the program, updates are available from the Celestial BBS in Ohio. I would, however, like to avoid making cross-Atlantic calls as "maintaining" the program would be prohibitivly expensive for me! ("Good Old" British Telecom apparently takes an 80% profit margin on these "competitively priced" calls!).

Thanks in advance for any information. Good DXing...

I just picked up a Signal One model CX7 with out the power supply.
Does anyone have any info one this rig??
Thanks.

And it is going to get worse. Last night I read in the May issue of MT that the Butt, er, ah, Bush administration (Dept. of Justice) has requested legislation which *requires* local telcos to provide authorized law enforcement agencies a mechanism to tap the new class of electronic communications (cellular voice, digital cellular voice, digital). It seems that it is just too hard for the *good guys* to spy on us. The worst part is that the law would require the telcos to pass the cost on to consumers. Get Back! This is absolutly outrageous!

I have read the ECPA and it is clear to me that the law says that if the communication is not speciffically intended for public reception then it is illegal to even *inadvertantly* receive it. The bozos in Congress clearly do not understand radio communications.

>Jon

The reason most ECPA violations are unchallenged is because most can never be detected. The real issue with the new anti-scanner legislation is that it will prohibit the sale and manufacture of radio equipment that is capable of receiving cellular frequencies.

Such an outright ban on the availability of radio receiving equipment that covers specific frequency ranges has NEVER, to the best of my knowledge, ever been done before.

As with most thing that the government meddles in, today the discussion is just on cellular frequencies. How quickly other groups that use radio are likely to ask for such similar protection (ie. scanners/receiver legislation that would ban frequency coverage that picks up police, etc) is anybodies guess, BUT if you grant such protections to one class of radio use, the stage has been set for other's to follow.

Standard Disclaimer- Any opinions, etc. are mine and NOT my employer's.

I have some ideas for experimentation with digitized voice that I'd like to pursue, BUT...

I have no background in digital signal processing at all, nor do I know anything about the current crop of DSP chips.

I gues what I am looking for is, at the very least, some pointers as to where to look for tutorial information.

Thanks and 73

1675. Kenwood TH-78A.

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 14:00:48 UTC
From: aviator@athena.mit.edu
Message-ID: <1992Apr30.140048.19279@athena.mit.edu>
Source record: 290399

In a previous posting, I highlighted some of the capabilities of the new Kenwood dual band handheld, the TH-78A. Here I want to point out some its weaknesses, and possible problems I've encountered during evaluation.

The human interface is a little bit complex. In particular, the way the rotary encoders for volume and tuning are implemented. The manual is relatively poorly written, with spelling mistakes and japanenglish (e.g. "temporally" instead of "temporarily", which is nearly unpronouncable for many Japanese).

The receive audio is more than adequate. However, the transmit audio seems to be slightly lower quality than the TH-27A. I'd like to hear what other TH-78A owners' experience is regarding audio quality. In particular, when using the SMC-33 speaker microphone mobile I've gotten reports of distorted audio. I have not been able to reproduce this in the shack. Anyone else using the TH-78A with the SMC-33?

Now, on the RF side. I don't really know much about RF engineering, and certainly don''t have any measuring capability. However, as expected, it does seem less robust to unwanted signals compared to the TH-27A. Otherwise, overall receive performance seems similar, including the aircraft AM band (i.e. very good).

The manual has a warning regarding receiving two frequencies within the same band simultaneously. I don't have the manual here, but to paraphrase it, the ability to reject unwanted signals/images and overall selectivity/sensitivity can be reduced for certain frequency pairs. I've found at least one example where this seems to be the case. Try putting 146.61 in the VHF (left) side and 148.15 in the UHG (right) side. I get squealing noises and the squelch is open constantly on 146.61. Reversing the sides removes the problem however. I'd like to hear from other TH-78A if they can reproduce this problem with the two frequencies I mentioned.

More disturbing is that I tried to use 146.61 (my local repeater) while using the radio in a single bande mode while mobile and got a horrible squeal and warble. I don't know if this is a problem with the radio, or the car installation. I was unable to reproduce it in the shack. Once again, I'd like to see if any other owners could test this particular frequency.

In general, the dual in band receive capability works great. With a speaker mike or headset, the output from one band can be retained on the internal speaker, thus separating the audio channels. This

works really great in the car. I can also monitor my favorite VHF repeater while working VHF packet. I'm willing to accept certain compromises in a dual band handheld, especially in the dual in band receive mode. I'm also trying to use a handheld as a mobile radio, which is not ideal. However, I'm a little bit concerned about the problems I were having last night trying to use 146.61. I'll try to do more testing tonight.

I'd be willing to start a TH-78A owners mailing list. Anyone interested should contact me.

>Honda tales of RFI woe welcome too -- misery loves company... :-) :-)

Well, I don't have tales of woe but just the opposite. I have successfully installed/use an Icom IC-28H in an '88 Honda Civic DX hatchback and a Kenwood TM-701 in an '87 Acura Integra. Both cars use on-glass antennas (a Larson on the Civic and Antenna Specialists on the Integra). I ran the power directly from the battery to the radios in both cases and have no additional grounding at the radios.

I have noticed no ignition noise problems in either car... although I do sometimes get a thump in the stereo of the Civic when the -28H is keyed. This is due to a poor match to the Larson antenna which continually degrades due to corrosion from our salty Minnesota winter roads. It will soon be replaced by an Antenna Specialists which have performed flawlessly for me on the Acura.

Have you run seperate power to the radios directly from the battery ?

Good Luck!

RE the TH-78A headset:

Can it be put in a sidetone mode?

My wife and I use our TH-77As bicycle mobile, full-duplex
quite frequently and are frustrated by lack of sidetone, i.e.
reproduction of one's own voice in the earpiece. With vox,
there's no indication that the transmitter is on; either way,
it's difficult to modulate voice loudness over wind noise
without the feedback.

I'd like to know if Kenwood or any other manufacturer has thought
of this, especially since the telephone company figured it
out a century ago.

Source record: 290402

In ye olde shacke I have a RF Concepts 2-23 2m all mode amplifier, which I dearly love :). However, I just replaced my 2m handheld with a dual band handheld. Obviously, I can't use the RF Concepts 2-23 to amplify UHF output. My question however is whether there would be any harm at all in passing UHF signals through the amp when it is turned off? My guess would be no, but I want to know for sure. How about using the pre-amp in UHF and just leaving the power amp off?

Thanks...Joakim

Mike,
I heard from a RS employee who said that the manager, who is a
ham, said that the HTX-202 is made by Uniden, based on inquiry and
"comparative anatomy" (my term). Sounds reasonable. I understand the
Icom possibility, since it uses Icom-compatable batteries (BP-8x
series), but the display doesn't look like anything Icom makes. And
since I don't know Uniden's line at all, I cannot dispute that
possibility.

>

I suspect that the normal current levels one would expect to find on the ground would not cause problems. However, my house suffered from a close lightning strike a few years ago. The motor control lines from the bedroom window to a R3 antenna brought enough induced current in to burn through 3 feet of wall from the window sill down to the heater duct in the floor. I normally disconnected the control lines at the window. From the duct in went through the furnace where the logic board controller caught fire and then to the incomming water pipe which was copper into the ground for some reasonably long distance.

Immediately afterwards, turning on the cold water gave you copper colored water. Not just a little color, it looked like molten copper at first. We had to let the water run for about 5 minutes to get rid of it.

However, with all that said - imagine what might have happened if there was no good ground! I would much rather have the safety and have to drain the water line once in a rare occasion.

I have the same amp. I use my IC24AT with it. When the amp is off, the
amp is bypassed by the relay's inside. THerefore it is a straight
connection to the output from the input. UHF will pass thru fine. I
don not recommend trying to run UHF with the amp on.

In the design of the "ultimate" transceiver or receiver, rather than
design it just as a peripheral, try to modularize the internals. That
way, as technology improves/changes, you put in a new frequency synthesizer
ONLY, or a new RF filter section ONLY, or new IF filters ONLY. If the
interfaces between the modules are defined properly, obsolescence of any
hardware can be avoided.

Wow... ! Back in the late 1960s and early '70s, that was one whiz-bang rig. It had two independent VFOs; a Big Deal back then, although a standard feature of most new rigs today. If it all works, it should do a good job for you. I seem to remember ads in the QST classifieds offering service for those rigs, so you might check there if you need parts or repairs. Good luck.

A RELATED SUBJECT.......

Who sells AC generators (ONLY). I have a nice 3 HP horizontal shaft lawn mower engine that I would love to connect up to a ~1000 watt AC generator... I have never been able to find anyone selling a generator only. Who sells them? Any idea what one would cost?

My only other alternative is to connect the engine to a large automobile alternator/12 V battery for an emergency 12V supply and use an inverter. But I would really prefer 110 AC.

TWO GOOD WAYS TO EMININATE OR REDUCE
EXHAUST NOISE FROM YOUR FIELD DAY GENERATOR
---

1. USE A POST HOLE DIGGER AND DIG A "POST HOLE" ABOUT 4 OR 5 FEET DEEP. REMOVE THE MUFFLER AND DROP A FLEX PIPE FROM THE EXHAUST DOWN TO WITHIN ABOUT 8 INCHES FROM THE BOTTOM OF THE HOLE. MAKE SURE IT DOES NOT REST ON BOTTOME OF HOLE. MAKE SURE TO FILL THE HOLE AFTER FD IS OVER.

2. EVER SHOOT A RIFLE OR SHOTGUN STRAIGHT UP INTO SKY? IF SO, YOU PROBABLY NOTICED THE REDUCED REPORT. PLACE A MUFFLER ON A PIPE THAT CAN BE STUCK INTO THE GROUND NEXT TO YOUR GENERATOR AND MAKE SURE THE "TAIL PIPE" IS 6 OR 7 FEET IN THE AIR AND POINTS STRAIGHT UP.

>the manufacturer even showed a graph of TOI versus offset frequency
>for the TR4 and TR7. As I recall, the TR-7 was 10 or 15 dB better
>close in, but much worse far away.

My Heath SB-301 used to be almost unusable on 40 meters in the evening.
There was so much intermod/junk down at the lower end which I traced
to being simple mixer overload from the BC stations 100-200 KHz away.
The front end did not have enough selectivity.

I added a homebrew 40 meter filter/preselector that has 2 very sharp, lightly
coupled tuned circuits and a low noise preamp to make up for the loss.

I adjusted the preamp gain so the filter had zero insertion loss at the
frequeny it was tuned for. It showed something in excess of 60 dB of
loss 100 KHz away. This thing is sharp! Peak it for 7005 and the receiver
never even sees Radio Moscow at 7150, etc.. The difference was greater
than night and day. Weak CW signals at the low end of the band appeared
out of nowhere!!!

I suppose if the 301 had better mixers then all of this extra filtering
would be unnecessary. Of course the filter does not work as good up in
the phone band since that is were the strong BC stations are.. but it
helps a little.

>
> Rob

If you live in a metro area there will be lots of both if you live out
in the sticks, then you are likely to have only a two meter repeater.
They are both useful but there is no doubt that 2 meter FM remains the
most widely used of the two.

Multiband rigs (those that cover both bands) are not that much more
expensive than single band rigs. I think that you should at least
consider a two band rig.

Perry Scott AA0ET:
Myself and another ham are currently building an ACSSB repeater to install here in the Los Angeles area and are submitting a request to the coordinating commitee for a frequency pair. In LA there is a long wait for FM repeater coordination but so far there are no ACSSB repeaters in operation. We are hoping to have the unit ready to install by the end of MAY.
There is a lot of work to be done yet. However it look like we can make it.
The next project will be to make some hand held units to use this mode.
We already have moble units in operation. We are also forming a club to expirement with this and other modes.
We will keep the net posted as to our progress.

Hello PNW Hams...

Having recentally mover to Oregon to enter graduate school here at
OGI, I have left my college radio club which both got me into
amateur radio and supported me for 3 years with an excellent HF station
and a top-grade repeater. Alas, it's a long way to Caltech for 440....

I am haven't been active up here for 6 months because of (1) my lack
of time from school and (2) I sold my loved Kenwood 75A in a moment
of financial need.

I am curious about ARCs in the Hilsboro/Beaverton area which are
fairly active and, among other things, will be holding a field day.
I am also interested in the split in usage between 2m and 440 here.
I am purchasing a new HT and would rather not spend the extra $$
for a dual-bander again.

In addition, I am also looking for a repeater with autopatch which
has good coverage in the Tualatin River valley, either 2m or 440.
Im my ARRL repeater guide, there is a set of W7CLU (449.225, 449.325
and 147.04, 147.32) repeaters with "ARRG" as the sponsor. I often
found time to enjoy both of my hobbies, cycling and amateur radio
together in my undergraduate days, and would like to have a machine which
covers the areas I cycle in, espically the Tualatin Basin.

Thanks in advance and 73, de N6XHW
D. Reeves

(NOTE: Some of you will be put off by my having a N6 call, but I went
to CA because I thought it would be a great place to go to school.
I found out it's a great place to be a HAM, but a terrable place to
live. No flames, please.)
73, de N6XHW

I think your RS is suffering from poor management. I was happy
to view one on the shelf of a very small RS here in Fresno yesterday.
It was right along side their 10 meter rig. I would have asked
to look at it (I needed to bring up the auto patch to make a call
and didn't have my HT with me :), but the sales driod was pretty
busy.

Take your business elsewhere. Make sure they know it too. :)

In article <kvqv90INNrtb@west.west.sun.com> flloyd@L1-A.West.Sun.COM (Fred Lloyd [Phoenix SE]) writes:
->
->Details/Info about The Summer of '92 CALLSIGN PROJECT
->
->Rusty, N7IKQ and myself AA7BQ, are putting together a summer
->distribution of the FCC callsign database. The database, which

Er, don't blame me for THIS one folks, HE's the one who volunteered :-)

->is roughly a 50 Mb ASCII text file, will be distributed along
->with some free (shareware) UNIX C source code to handle fast
->indexing and retrieval.

I'm betting it breaks 54 meg this time.

->The May 1 cut of the database has been ordered and should be
->available within about 8 weeks (yes, the government is slooooooow).

Boy, is HE optimistic! I've long ago decided that one never
should second guess the NTIS... Remember last time? They
sent me data almost 6 months old!

->Distribution Media, Formats, etc.:
->
->The preferred distribution format is 1/4 inch cartridge tape,
->with QIC-150 (DC6150) being the best. We can also support
->QIC-24 (DC600A/60Mb) tapes, as well as 9-track reel-to-reel
->tapes. Default data format is UNIX tar unless otherwise
->specified. Other formats include 'dd', 'cpio' and (gasp)
->EBCIDIC 'dd'. No source code will be available with the
->'dd' formats.
->
->Absolutely no floppy disk copies will be made.

We don't need no steenking floppies :-) (But, really, I've done
ms-dos floppies in the past and it was QUITE a labor-intensive
thing - I sure dont' blame Fred for not wanting to have to deal
with babysitting the floppy disk drive every 90 seconds! for a
solid 30 minutes... Actually, if someone is DYING for floppies,
I MIGHT be coerced into making a copy or 2 (ACK! NO!!! PLEASE!!!) :-)

->Below is a sample entry for a single callsign from the data file
->(there are in excess of 500,000 such records in the file):
->
->KB0A|FORRETTE||CLAY|H|28321|87048|97048|RT 2 BOX 343|SIOUX FALLS|SD|
->57103|3 MI SW OF|BRANDON|*|E|||*

Wow, somebody other than AA0A, the standard example! :-)

->Fields are separated by the | character, and are:
->
->call|lastname|jr/sr|firstname|mi|dob|effective|expires|mail_street|
->mail_city|mail_state|mail_zip|loc_street|loc_city|loc_state|class|
->previous_call|prev_class|process_date
->
->Missing fields are not applicable. Fields with * are the same as
->corresponding field elsewhere: in the example above, the first *
->means that the location state is the same as the mailing state.
->Dates are in the mod(100) year plus julian days format.

I wish I'd done this good a job in the past explaining those *'s!

->Copying Costs and Shipping:
->
->The cost is $20 per copy. You must supply the recording media
->along with a self addressed and prepaid mailing label.

Don't forget about insurance if you want it! This bit me in past
years (think we only lost one or two tapes in my 3 years, but
we DID have one tape un-writable when it arrived due to
poor design of the tape wring .. er.. tape seal (it did not
hold both sides of the tape and allowed pressure on the reel
to translate to pressure on the tape. The tape got bent/crinkled))

->Preferred shipping is via FED-X, UPS, and USPO in that order.
->
->Proceeds will help cover the cost of obtaining the data from the
->National Technical Information Service (NTIS) which currently
->stands at over $700.
->
->Ordering:
->
->Please e-mail all requests to:
->
->Fred.Lloyd@West.Sun.COM (internet)

Thy mailbox runneth over :-)

(If mail bounces to fred (VERY unlikely, but you never know), feel free
to send it to me (HA! Talk about bouncing mail! :-) and I'll
forward it to him. Also, I am hereby encouraging Fred to
(1) get a p.o. box and (2) post it so folks can just stick their
tapes and stuff into a box and snail-mail it to him. Remember,
we are busy waiting for the Guv'mnt to make us a tape, the USPS
will EASILY beat them, so you might as well send the tape now and
beat the rush (and the cost of fedex or ups))

Date: 1992-04-30 16:16:33 UTC
From: wpns@pictel.com
Message-ID: <1992Apr30.161633.289@pictel.com>
Source record: 290421

perry@hpfcmgw.FC.HP.COM (Perry Scott) writes:
>Has anyone ever played with ACSSB ?

>The advantage of ACSSB is that it only takes 3 KHz of bandwidth while
>NBFM takes 6+ KHz.

Well, actually, NBFM takes up around 15, which is why repeaters and simplex channels are spaced at 20 KHz (well, except for some that are local-option 30 with inputs and outputs staggered or something...), so the gain in bandwidth per hertz is at least 5X, assuming you don't need much guardband for ACSSB.

One of the reasons that Fedex gave for taking a bite out of 220 was that they could be more efficient using ACSSB, but after getting the frequencies they decided it was too much trouble and they'd just use NBFM... Sigh. I'd like to see ACSSB take off, if it works, it might be a neat mode.

I'm not sure what the technical problems associated with ACSSB are, or how it sounds, but I suspect that there are reasons it's not more popular.

1698. HAM going offshore!!!

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 16:39:34 UTC
From: zielke@FOZZIE.NRL.NAVY.MIL
Message-ID: <9204301639.AA18897@fozzie.nrl.navy.mil>
Source record: 290422

I am looking for suggestions for a small 12V HF rig to be used on a boat going offshore this summer. I don't need a tremendous amount of power, but will probably be working with a insulated backstay (i.e. About 30' of stainless stranded wire (1/4") with insulators at each end, slope about 30 to 45 degrees, large metal pole (the mast) holding it up). I could cut the backstay for a specific frequency or use a tuner. Ground plane will be provided by a Dyna-Plate (equiv to about 20 sq ft of copper immersed in salt water).

12V power is at a premium so being able to reduce power for transmitting while maintaining reasonable efficiency is a must.

Looking for an older rig (or at least low cost). Any suggestions most appreciated.

Thanks in advance

Until I can come up with the time and money for a tower and 'real' antenna,
I'm looking for alternatives.
Can the 'average' residential chimney support a small tribander and rotor
without guying? This has to be a no-holes-in-the-roof installation to
pass my wife's review.
I'm talking about something on the order of 3 to 4 square feet of effective
surface on a short mast.
I asked the guy who re-built our chimney about this and got the telephone
equivalent of a blank stare in response.

From: njohnson@sysad.cnde.iastate.edu
Message-ID: <1992Apr30.164244.11611@news.iastate.edu>
Source record: 290424

Thanks to all who sent me HT reccommendations!

I received 8 responses:

2 reccommended the ICOM W2A
2 reccommended the YAESU FT-470
2 reccommended the Alinco DJ-580T
1 reccommended the Kenwood TH78A
1 reccommended the ICOM 24

I got the most eloquent recommendations (and information)
for the Alinco. Considering its features and price, it is
the one I'm leaning towards right now.

My friend likes the W2A because of its out of band receive
capability, but I don't like its size and cost.

If someone has more information on the Kenwood I'd appreciate it
if you could e-mail it to me.

Again Thanks to all for the help!

1701. Grounding and lead in water

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 16:45:12 UTC
From: taylor@tix.UUCP
Message-ID: <9204301559.AA04128@timeplex.com>
Source record: 290425

On the subject of not grounding your water systems (copper pipe etc.), NFPA 70 (other wise known as the National Electrical Code) requires that ALL mettalic water systems in dwellings be grounded and where possible also bonded to an 8' (min. 5/8" dia.) copper clad or approved driven rod. The Ground rod and water ground are to be used together. Ungrounded piping is a code violation, even if the street connection is non metallic. The idea is to be sure that the pipes in the home are at ground potential for safety considerations.

If the street connection is non metallic, the code requires that the pipes be bonded to a ground rod or other "approved" means. Copper pipes today are soldered with a non lead alloy solder (check ur local plumbing supply). In older situations, that were installed years ago, unless the pH of the water is under 6.5, I would not worry about lead in the water supply. Simply flushing the line for a few seconds will remove any trace amounts.

Seth T. KC2WE.... the opinions are my own and not those of
ascom Timeplex.

1702. One more HF radio Question

Ok, it's down to a Yaesu 757 or an ICOM IC-730.

Anybody have particular praises or problems they might
like to share with me. I've been buried under books
for a few years and have lost touch with the "newer" radios
but it's time to upgrade.

Thanks, Mike, WB2TBQ

1703. 1750 Meter Band Information Summary

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 17:20:08 UTC
From: pulse@meaddata.com
Message-ID: <1992Apr30.172008.2546@meaddata.com>
Source record: 290426

As promised, here's the summary of the information I requested
from the net a couple weeks ago regarding the 1750 meter band.

Does one need a license to operate on this band? No. This means that
you can choose your own callsign although callsigns are not required.

What is this band for? Experimentation mainly. It is especially fun to
attempt QRP operation and one respondent said that given the right type
of modulation and antenna setup, signals can travel 1000 miles or more
with just under one watt output! Lots of folks use CW beacons and there is
a radio club called The Lowfers (Low Frequency Users, presumedly). Be
aware that this IS NOT a ham band although several LF receiver manu-
facturers boast that their units can "receive the 1750-meter ham band".
You will not find discussion of this band in the ARRL publications
BECAUSE it is not a ham band. Perhaps some of the confusion here arises
from the use by LF operators of ham radio callsigns. Many hams also
operate in this band and use their own calls for identification, even
though, as mentioned above, a callsign is not required here.

What is the frequency limits of this band? The 1750 meter band spans
from 160 to 190 KHz.

What types of modulation may be employed? You may use CW and AM voice.
You may be allowed others (FM, RTTY, etc). But the data I was able to
gether was sketchy on this point. One person though said that there
are no restrictions on modulation methods.

What are the legal power limits and other transmitter-related
restrictions? Transmitter power is limited to somewhat less than one
watt output. The maximum power INPUT to the final should not exceed one
watt. The length of the antenna added to the length of the feedline
MAY NOT exceed 50 feet. Spurious emissions outside the band must be
60db below the signal strength at the carrier frequency.

Who may use the band? Anyone, so long as they comply with the above
regulations.

Where can I get more definitive and detailed information on this band?
The band is discussed in Part 15 of the Code of Federal Regulations which
you can pick up at your local library (assuming it is a fairly big library),
or you can order it from the nearest US Government Bookstore. If any-
one knows where such a store is, please post its location. I'd like
to snag a copy of Part 15 myself.

Thanks to alan@dsd.es.com, kludge@grissom.larc.nasa.gov,
kc2wz!bob%fdurt1@uunet.UU.NET, brown@hpspkla.spk.hp.com, markz@ssc.wa.com,
and gary@ke4zv.uucp for all the information they provided.

Happy Lowfering! :-)

[deleted]
> >Anyway - I think that CBers are our enemies in many ways and that we should be
> >supporting every move leading to destruction of CB.
>
> Hm... Couldn't find any rational arguments against CB here...
> I fully agree about pirates but why do you want to destruct CB
> and not the pirates ?

Simple - because this is the place when people get used to situation that only thing needed to operate radio is a transmitter, that everyone is anonymous (using all that fancy names) and if you don't like someone then you put a carrier or just say a few "nice" words. And if others do this to you, then you just buy a 1kW linear, and talk on top of them. Of course most of them has ony sligth idea about such things as SWR etc, and most of the eqipement used is of very poor quality - which is quite obvious at it's prices. Situation is even worse if appropriate authorities are in fact powerless - mostly beacuse of ecenomic situation of the state and budget cuts. State Radio Agency here is for example using AR 3000 scanners fro monitoring the frequencies - the can't afford really proffessional eqipement. But even worse is the legal sitation - in fact SRA inspectors cannot enter somoene's house to inspect the equipement used without owner permission. Result? CBers from 26.000 to 28.300 - and CBers sure of their impunity.

So CB is a place where pirates are born. Of course - some of them, with real interest in radio, grow up and become amateurs - but it takes some time to get rid of CB customs and get used to ham rules. Others just sell their CBs and get ineterested in fishing.

But there are people who will buy a UHF rig at a CB store (and salesperson wouldn't even say a word about any licenses etc - he is a CBer also) and chat at ham or public service's frequencies. Or they will set up a duplex telephone link on 144.270 and 132.270 (there was such a case). Or they will just make some QSOs under bogus callsigns etc.

Without CB all these people would know, that radio is a business for proffesionals and licensed amateurs, or they even wouldn't know that - they would just use telephones. They will not have a chance to become pirates - and only few determined ones would become pirates.

> I agree that CB band in Poland is getting more and more crowded
> but would say it's not the CBer's fault. Here in Krakow CB channel
> occupancy is close to 100 % but people are still polite.

Well - I wasn't monitoring CB there, but it's hard to belive. Of course there
are polite ones - but they are outguned.

> I must say I'm nicely suprised about it.
> However from what I know (but these are unconfirmed data)
> it is not that nice in Warsaw...

Yes, from what I know is the worse place in Poland - but here is more CBers
than in any other city.

> Some background for foreign readers: Last exam for amateur license
> in Poland was in March last year. The problem is not that there are
> no voluntier - there is no commity to give an exam. Due to introduction
> of new roules it needs to be formed and the date is still unknown.

Some corrections (also for foreign readers ;-): There are people who would be
more than happy to administer an eximine, but the Ministry of Transportation
and Telecommunication hasn't issued needed ordinances.
In response to (many) PZK (Polish Radio Amateur's Society - BTW: estab. 1930)
petitions Ministry promised to issue neded documents, and they said that first
exams would be possible in May. Well - we will see.

> Thus lot of young people truely interested in radio go for CB.
> This effect adds extra load on CB band.

It may be an increase of 5% - no more. Most of them don't even know about
existence of amateurs, but that's another story.

Yes. Especially beacuse appropriate authorities are not so interested in
locating interference to ham bands - they have enough work elsewhere - and not
enough funds.

Recently we got an agreement with Warsaw State Radio Agency Inspectorate -
something like FCC FOB out there. Members of the Warsaw's PZK Monitoring
Comission would be issued with SRA inspector's authorizations (ID cards),
with authority limited to the cases of interference to ham bands.

> >Anyway - I think that CBers are our enemies in many ways and that we should be
> >supporting every move leading to destruction of CB.
> Whoa! Maybe that's going just a little too far. Not all CB'ers are evil.

No - I didn't say that CBers are evil. CB is evil.

> [As flame retardant - yes, some are evil or worse.] I can tell you that there
> are many people who get a CB in hopes of reliable communications. They find
> varying degrees of disappointment or success in that goal. (It's really only
> useful if you have friends with CBs nearby.) As they use it, the exposure to
> radios makes many interested in it. CB is a ripe recruiting ground for new
> hams. And I mean disciplined and courteous ones, too!

Yes, but as I wrote in another msg - it is also recruiting ground for pirates
(even courteous ones B-). And I think that hams could live without it, but
there would be less pirates on the air - less exposure to radios in such a
Wild West enviroment.

The airlines do not want you to use any receiver in the airplane. Tape players such as Walkman etc. are ok. They say that receivers can cause problems with the navigational equipment on the plane. I am not sure that it could but I guess its possible. Its ok to listen in the terminal but put it away when you board.

In ye olde shacke I have a RF Concepts 2-23 2m all mode amplifier, which I dearly love :). However, I just replaced my 2m handheld with a dual band handheld. Obviously, I can't use the RF Concepts 2-23 to amplify UHF output. My question however is whether there would be any harm at all in passing UHF signals through the amp when it is turned off? My guess would be no, but I want to know for sure. How about using the pre-amp in UHF and just leaving the power amp off?

Thanks...Joakim

A friend thought the same thing. He figured that he'd simply turn the amp off when he was working on UHF and run barefoot. I don't know what kind of amp he has, but it didn't work that way. There appear to be some filters in there somewhere that attenuated the UHF signal to nothing useful at all.

>I have read the ECPA and it is clear to me that the law says that if the
>communication is not speciffically intended for public reception then it
>is illegal to even *inadvertantly* receive it. The bozos in Congress
>clearly do not understand radio communications.

The situation, however, is that more and more people are learning that just having the law does NOT preclude their neighbor with a scanner or equivalent radio receiver capable of receiveing cellular from listening, regardless of the law. SO....to create a perception that cellular is safe from prying ears, the industry wants to outlaw any type pf radio receiving equipment that can receive cellular frequencies. In so doing, they can claim (incorrectly) that it isn't legal to listen and that the equipment that could be used to listen is illegal to manufacture and sell. Obviously, such a statement, if used in sales promotion, totally ignores the many pieces of equipment already sold and that would likely be "rushed to market" between the time the "manufacturing prohibition legislation" is passed and when the actual ban against manufacture would occur (6 months or a year I believe.)

Additionally, it ignores the trivially simple design and availabity of a broad band converter that could be used to frequency shift the cellular frequencies to a frequency segment that is not "against the law. to have a receiver for.

I have a fundamental problem anytime the governemnt atempts to "outlaw" any type of electronic equipments. Do we really want electronic police trying to determine what any piece of equipment is capable of being used for? I don't.

...usually a bad combination. I've found filling threads, slip joints, etc. with anti-seize compound (or Noalox) to be helpful in preventing the salt water from infiltrating via capillary action.

I use Permatex anti-seize (silver plastic brush-in-top bottle), available at your local auto parts store. I have a Larsen 1/4 wave whip on the roof of my car. The end of the whip is dipped into the anti-seize compound before being inserted into its bushing. The threads of the setscrew which clamps the rod into the bishing are also liberally coated with anti-seize.

I use silicone grease on the o-ring and plastic threads. No problems with corrosion any more, and it's been 3 New England winters worth of daily commuting.

I recently bought some HF gear and am in need of manuals for them.
Are there any vendors who sell owner's manuals and shop manuals.
Alternatively if someone who has the manuals could photocopy and send
it to me, I would be more than happy to pay for the costs of copying
and mailing. Below is a list of the manufacturers and equipment.
I have send away to Hi-Manuals (or something like that) but they
haven't gotten back to me. Thanks.

Manufacturer: Yaesu
Item : FT-101B Transceiver

Manufacturer: Yaesu
Item : YO-100 Monitor Scope

Manufacturer: Yaesu
Item : Landliner (phone patch/external speaker)

Manufacturer: Yaesu
Item : FV-101 External VFO

Manufacturer: Reliable Electronics Design Company
Item : REDCO-C40 Frequency Counter

Manufacturer: Reliable Electronics Design Company
Item : Model RPS-1/C-40 Power Supply (for above unit)

Manufacturer: ?Turner?
Item : Turner Expander 500 Microphone

Manufacturer: D&A Manufacturing Co.
Item : Warrior KWD 1000 (I think this is a linear amp but not sure)

Manufacturer: D&A Manufacturing Co.
Item : Warrior 220 Power Supply (for above unit)

Larry,

A friend of mine bought the TM-732, the new Kenwood dual band mobile for 2m
and 440. A very nice radio! And he got it for $ 600.00 at Dayton! A
detachable head and very small size.

Mike,

Get something nice that's used. A good used ICOM 730 is around $ 400.00 and a good used Kenwood TS 120 or 130 is from $ 350 to $ 400. That is, of course, if used is OK with you. New your choices are the Kenwood TS 140 or the ICOM 725. (I'm sorry I can't comment on Yaesu, I am really not familiar with their equip.)

1719. Examination Opportunities Scheduled 4/30/92 to 6/15/92

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 19:53:51 UTC
From: bjahnke%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <612@arrlhq.UUCP>
Source record: 290342

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information, or by mail at 225 Main St, Newington CT 06111.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you will be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials.

AFTER THE EXAM - HOW LONG WILL IT BE BEFORE MY LICENSE ARRIVES?

If you've recently passed your initial examination for an Amateur Radio license, or if you've just upgraded, please accept our warmest congratulations! Now that you've passed the test, receiving your license in the mail is the next step.
Since the FCCs current license processing time is at about seven weeks, and since there can be additional time required within the volunteer examiner system of two weeks or so allowing your VE Team and VEC (if for Technician class or higher) time to process your application, your license might not arrive for up to eight to ten weeks.
To keep your wait for that new license or upgrade as short as possible, we are taking the following steps to give you the fastest possible service.
We have begun providing our VE Teams with express OVERNIGHT mailers for the return of applications from ARRL/VEC exam sessions to us at the VEC--and we at the VEC have begun sending our daily packages to the FCCs Licensing Facility via an express OVERNIGHT service.

We are also encouraging our VEs, and imposing
the same emphasis upon ourselves, to process examination
packages as quickly as possible to expedite your license.
Having implemented the above procedures, the ARRL/VEC
wants your wait for your new license to be as short as
possible.
If you have any other suggestions about the program, or
services we provide, please feel free to contact us.

THINGS TO BRING TO THE EXAMINATION

Be prepared to bring the following items with you to VEC
examinations: Your original current FCC-issued Amateur
Radio license (and a copy of it)--if you are licensed; Any
original Written or Code Element credit documents (CSCEs)
which are currently valid; Two forms of identification
(e.g., a photo-ID or drivers license and another item
indicating your current name and address); A calculator (if
necessary); A pen and two pencils; and, the applicable
examination test fee.

TECHNICIAN CLASS GRANDFATHER CREDIT

If you hold a Technician class license which was issued
prior to 3/21/87, you are not required to take the Element
3B (General class written) examination if you can provide a
copy of your FCC-license dated before that date. If your
licensed has since been renewed, and if you don't have a
copy of the pre-3/21/87 license, you must seek a
verification letter from the FCC. To do so, write to FCC,
1270 Fairfield Rd, Gettysburg PA 17325-7245 and request a
Form 1010-B Verification Letter verifying that you were
licensed as a Technician class prior to 3/21/87. After you
receive that form from the FCC, bring it to the test session
with you in order to claim your deserved credit.

LOST LICENSES

If you have lost your license, be aware that VECs are not
permitted to submit any upgrades to the FCC without a copy of your
current license attached to the 610 form. In order to
expedite your upgrade, you must write the FCC and request a
replacement license. Since that can take several weeks to
arrive, we recommend that you also request a Form 1010-B
verification letter from the FCC which will arrive in a
couple of weeks--and is legally binding license document.
You may use that form as a license until your Form-660
license arrives. The original and a copy of Form 1010-B
must be brought to the test session verifying that you are
currently licensed--the copy of which will be attached to
your upgrade application (in lieu of an actual Form-660
license copy). To request the Form 1010-B Verification

Letter, write to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245; indicating that you lost your license and that you are requesting that a replacement license be issued to you--also be sure to request that they send you a Form 1010-B Verification Letter verifying that you are licensed.

ACCOMMODATIONS FOR THE HANDICAPPED OR DISABLED

The FCC requires that the administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. To do so, the administering VEs may require a physician's statement indicating the nature of the disability before determining which, if any, special accommodative procedures must be used.

The VEs may accommodate handicapped/disabled examinees by administering the examination at a place convenient and comfortable for the examinee--even at bedside; for the hearing impaired the Morse code may be sent using flashing lights or a vibrating surface; for the visually impaired, VEs may read or write for the examinee; where warranted, the VEs may pause the Morse code message after each sentence/phrase, or each word, or even after each character to allow the examinee additional time to absorb and interpret what was sent--also the VEs may substitute a sending test for a receiving test where the examinee's handicap warrants.

VE Teams may need advanced notice in order to provide the necessary accommodations to examinees who require them. If you will require accommodations, please contact the VE Team in advance to advise them of your needs.

EXEMPTION OF THE 13/20 WPM MORSE CODE REQUIREMENTS

If you are a severely handicapped or disabled individual and have already passed at least a 5 WPM Morse code examination (or hold a license which meets that requirement), you may be eligible for exemption from the 13/20 WPM Morse code examination requirements. For information and applicable forms, send an SASE to the ARRL/VEC, 225 Main St, Newington CT 06111; and request our Handicapped Information Package.

EXAM LISTINGS - DEFINITION OF FIELDS

1720. Re: Bob Kay (was CMT/Scanner ban...)

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 19:56:06 UTC
From: rats@cbnewsc.cb.att.com
Message-ID: <1992Apr30.195606.15798@cbnewsc.cb.att.com>
Source record: 290343
Cross-posted to: rec.radio.shortwave,alt.radio.scanner,rec.radio.amateur.misc

In <DCTL2M@ais.org> Tim Tyler states:

|>[Excerpted from Monitoring Times, May 1991, "The Scanning Report,"
|>by Bob Kay.]

The date should be "May 1992."

|Also, someone ought to advise 'expert'
|Bob Kay that the CMT band was expanded to (roughly) 824-849/869-894mHz
|several years ago...

Yes. I found that awfully strange that he would print 870-890Mhz.

| I did this last November. If Bob Kay had done it, maybe he would have
|received a response similar to the one which I received (& had enterred here
|a few months ago). In a letter dated 10 JAN 92, Senator Carl Levin states:

| (Reiterating H.R. 1674)... The Senate's version of this legislation,
| S.1132, contains no manufacturing prohibition on radio scanners.

However, since the House H.R. 1674 _DOES_ include the cellular scanner
ban, and should the Senate S. 1132 indeed pass the Senate as is, a
House-Senate conference committee reconcilation of the two bills might
still yield a cellular scanner ban of some sort.

Best that people still contact their Congressmen and Senators concerning
any cellular scanner ban.

1721. Re: Morse in "Morse"

Thanks! The show is shown here on in the states; I will have to listen (
tonight in fact). My wife and I love the show.

1722. Electrolytic Caps

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 20:05:45 UTC
From: cfishman@pica.army.mil
Message-ID: <9204301352.aa06724@FSAC1.PICA.ARMY.MIL>
Source record: 290345

I repair old (and new ham rigs) as well as audio equipment. Several tube audio amps had electrolytics wich were physically good looking and had not dropped one drip, but were totally useless. One 1000 ufd cap was 10 pf....no lie and several others were in similar shape. No great damage to the amp ....just lots of hum. My plactice for my gear is to change caps about every 10 years on pro audio equipment etc......now its time for your war stories..

Clark Fishman WA2UNN cfishman@pica.army.mil

1723. Re: What the *$#%$@ is 70cm?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 20:10:19 UTC
From: ron@pilot.njin.net
Message-ID: <Apr.30.16.10.18.1992.1059@pilot.njin.net>
Source record: 290346

I've got a dual band hand held. It's the only radio I really use on VHF/UHF. How useful 70cm is to you really depends on where you live. In mid-NJ there was lots of stuff on 440. Down here in the D.C. area, despite the fact that the band is full based on coordinations, it's relatively dead in the repeater band. Of course, this is only voice story. Even down here there is 70cm ATV and it is also where the higher speed packet stuff lives. Of course for these things, you wouldn't use an FM voice rig, so I'd check on how much use you would make before investing in seperate or dual band rigs.

-Ron

1724. Re: Signal One CX7

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 20:12:04 UTC
From: ron@pilot.njin.net
Message-ID: <Apr.30.16.12.04.1992.1113@pilot.njin.net>
Source record: 290347

Most modern rigs do not have two VFO's, they just have two memories connected to the knob both of which drive the single synthesized oscilator.

-Ron

1725. Chimney mounted beams?

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 20:24:18 UTC
From: pzs@ficus.webo.dg.COM
Message-ID: <9204302023.AA01240@ficus.webo.dg.com>
Source record: 290348

Bad idea. The gasses that come out of the chimney are very
corrosive and the heat & gas will speed the rusting/corrosion process.
Also not very nice for plastic...like insulators and coax.

If you doubt this, take a look at a neighbor's TV antenn mounted
on his chimney.

On the structural side...you could probably get away with it for a
while, but you should mount the "bands" as far apart as possible to
spread the load as much as you can. (I'm assuming you'll be using the
stainless band clamps to mount the mast to the chimney.

Good luck...

Pete

Chart Start: Day #062

NOTES:
The 10.7 cm solar radio flux is plotted from data reported
by the Penticton Radio Observatory (formerly the ARO from
Ottawa). High solar flux levels denote higher levels of
activity and a greater number of sunspot groups on the Sun.
The 90-day mean solar flux graph is charted from the 90-day
mean of the 10.7 cm solar radio flux.

Can the 'average' residential chimney support a small tribander and rotor
without guying? This has to be a no-holes-in-the-roof installation to
pass my wife's review.

1728. Ham Radio Interference from Neighbor

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 21:11:27 UTC
From: remedios@hpindda.cup.hp.com
Message-ID: <5120018@hpindda.cup.hp.com>
Source record: 290352

I have a neighbor who operates a ham radio and I am getting
interference on my TV from it. I spoke to him about it and
he suggested my getting high pass filters for my TVs and my
VCRs. I did this but it did not help much. I spoke to him
again and he said that he is licensed and is operating under
the rules and regulations of the FCC. He said my only other
alternative would be to get cable TV. I do not wish to do
this. But even if I did, I am afraid that it may not solve
the problem because when I watch videos and disconnect the
outdoor antenna from my TV, I still get some interference
although not as bad as when I have the antenna attached.

Is there anything I can do besides getting cable that can
solve this problem?

Is there anything he can add to his equipment so it will not cause
so much interference? He says he uses low pass filters.

Thanks in advance,
Jim Remedios

I would recommend using a telescoping mast clamped to one of the higher parts of the house. They're not expensive and unobtrusive -- sink it in a few hundred pounds of concrete and clamp at the peak of the house (you did have to foresight to buy a two story house on a mountain top, didn't you?). Use a small tri-bander, TV type rotor and keep the mast within 8 feet of the clamp and you shouldn't need to guy it. Use a plumb-bob when aligning the mast, for aesthetics.

Don't put it above a working chimney, you'll turn your tri-bander black. Try to get ahold of a TA-33JR, it's small, rugged, has great performance and I have had nothing but exemplary service from Mosley: Last time I rebuilt mine (it's 30 years old), I found extra items in the box with a note from Ira Mosley telling me I'd forgotten a few things and he was including them free of charge. Nice touch; when I buy another antenna it'll be from his company.

A nice thing about the TA-33JR is: The higher you put it, the more apt the neighbors are to think it's a TV antenna. Mine's now on a 60' crank-up mast and while it looks huge down near the house, the perspective at altitude is wholly different. Resist the temptation to run more than 1KW SSB and you may have yours for 30 years as well (you could also buy new traps every now an then, like I do...).

I have a TA-33-Jr with a RadioShack TV rotator on a 10 ft mast which is guyed with three Dacron lines running to roof vent pipes. It works great (in comparison to a wire antenna). Try it; you'll like it, although the neighbors might not.

Source record: 290357

Well, at 86 mph there's about 22 lbs per sq ft. of pressure (from EIA-RS-222) and 4 sq. ft. of antenna is placing about 90-100 lbs horizontal load on ur mast. If the mast is say, 10 feet high, thats about 900 to 1000 ft/lbs of bending moment. Do you really want to do that to your chimney ?

Masts, towers etc. are designed for such loads. Masonry usually is less resilient[D[D[D[D[D[D[D[Ds tolerant of bending unless designed for the load.

Seth T. KC2WE...the opinions are my own & not those of ascom Timeplex

>Willie Smith
>wpns@pictel.com

Well, I kicked around the idea of building ACSSB equipment for a
senior project, and after I got into it a bit I realized that it
really would be very difficult w.r.t. FM, AM, SSB, etc. The idea
is to Phase-Lock to a subcarrier above (I think) the audio passband, like
4500 Hz or something like that. From this, the RF osc is locked to
this and the signal is synchronous demodulated. However, heres the problem:

This is difficult. Also the S/N of the subcarrier has to be enough for
the PLL to lock onto it, and the carrier and pilot tone need to be locked
to each other at the transmitter end, also. This is very tricky. Not
saying its impossible, but its tricky.

The "Amplitude Compandoring" is a system of non-linear pre-emp and
de-emp not unlike DBX. It is supposed to increase S/N and emulate
the "capture effect", but I really doubt if it'd do as well as FM.
(not completely educated guess).

Also, I cant imagine that the noise performance would be better than
FM. It'd give slightly worse performance than SSB due to the wasted
energy in the subcarrier (compared to transmitter w/same pwr.). Now
NBFM doesn't give much noise improvement over AM which is worse, of
course then SSB... I guess thats how they figure it would cancel out.
I'd need to see it to believe it.

I personally don't see the bandwidth savings to be good enough at this
time to trade off the complexity of the system.

So, instead I built a 70-cm transverter!

Fred M. Spinner, KA9VAW

1737. A few questions.

Newsgroup: rec.radio.amateur.misc
Date: 1992-04-30 22:42:30 UTC

Message-ID: <1992Apr30.224230.10241@cs.rose-hulman.edu>
Source record: 290362

I need to find a source for a commercially made 4-5 foot dish
of reasonable quality in a small quantity. Anyone out there
know where I could find such a source?

Also, anyone know the address and phone for International Crystal
Manufacturing in Oklahoma?

Lastly, for those of you knowledgable in the ham satellite area,
last night I received telemetry (AX.25) from Dove (DO-17) and
am curious if anyone can lead me to being able to decode this.
(for flamers: I joined AMSAT at Dayton, got their info sheet, and
it doesn't have this info)

Anyway, heres an exact sample (retyped by me):

SB DX ARL ARLD022
ARLD022 DX news

Thanks to Bob, W5KNE, and QRZ DX for the following DX information.

BURKINO FASO. Peter, XT2BW, is the only active station from Burkino Faso. His assignment is until December 1992, although a six to twelve month extension may be in the works. Listen for him on 40 through 10 meters, including the WARC bands. QSLs to WB2YQH.

CRETE. SV1AHH/SV9 will be active through May 3 on 20 through 10 meters, with an emphasis on RTTY.

CHINA. Operators at the Nanjing Institute of Technology club station BY4WNG, have built a TNC. DXers and tech wizards may check out a description of the TNC which is available on the VS6UF-1 BBS on 2111l kHz.

MICRONESIA. Barry, WC5N, will be active between May 2 and 9 as V63BW. Check 20, 17, 15, 12 and 10 meters for this mostly CW operation. QSL to W5EW.

M-V ISLAND. An all band/mode operation by a team led by UT4UZ is reportedly in the works for May 21 through June 16. Keep an eye on the Cluster for this one.

FALKLAND ISLAND. VP8s signing /92HY are celebrating Heritage Year.

UGANDA. The 5X5CW operation planned by John PA3CXC, has been put on hold due to hostilities in the region.

1741. Re: Chimney mounted beams

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 04:13:48 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992May1.041348.28174@cbfsb.cb.att.com>
Source record: 290368

You probably don't really want to mount the antenna near the chimney, as
the soot and other exaust will put carbon and stuff all over the antenna
and degrade performance. Especially on the insulation parts of the antenna.

I've used old steel water pipe (about 1 1/2" diameter) running from a
concrete footer in the ground up aside the house, and held by a holder
attached to the house just under the roof gutter to the sill board.
and extending about 8 feet above. We have a big TV antenna, a 2M ground
plane, a UHF TV antenna, and a small 3M (FM broadcast folded dipole).
All mounted on the same mast. For about 6 years at least.
Use continious lengths of pipe above the top mast support. Pipe unions
arn't designed to take twisting or bending action (remember statics and
dynamics class?).

1742. 2SAT backlighting

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 06:33:24 UTC
From: sknapp@iastate.edu
Message-ID: <1992May1.063324.10846@news.iastate.edu>
Source record: 290369

Hello all,

The backlighting on my Icom 2SAT suddenly went bad, the light no longer works at all. The light button does still work (the light-B-# extended receive thing works fine). The radio is not more than 6 months old and did not have the light used to what I would call 'excess'. Any ideas? Anyone have this problem?

Does anyone know of a cheaper than Icom service facility that they wish to recommend? How about bash? (Because when all else fails, it is getting sent back.

Thanks!

Hello all,

I was thinking about 'investing' in a Fluke 79 DMM. Any
recommendations? Opinions? The 80 series is too expensive. But I can swing for
the 79. Also is $150ish a fair price? A good price? (interested? I can get you
the PH# of the distributor)

PLEASE EMAIL as I do not read this group often enough...
If there are any FAQ's pertaining to this or reviews of DMM's on file
somewhere please direct me!

Thanks in advance!

Source record: 290371

It seems to be seen as heresy if anyone criticies the R390. One interesting thing worth reading is "Symmetric MOSFET mixers of high dynamic range" by R. P. Rafuse P122-123 of the proceedings of the 1968 international solid state circuits conference. (friday 16th Feb 1968, University of pennsylvania)

Rafuse has the sense to measure the R390 with signals inside the bandwidth of its preselector, and quotes a -7dbm single tone signal as causing 1 dB suppression of a weak signal. He rates the R390 as having 79dB dynamic range, but one has to be careful with this sort of data, there are many different definitions of dynamic range.

If you are interested in high dynamic range receivers, you may find it worth looking up the G3PDM recever published by the RSGB in their " Radio Communication" handbook (their equivalent of the ARRL handbook) depending on the age of the book you find, you will see either the mark 1 or mark 2 version, it is worth tracking down both.

The mixer in rafuse's paper quoted above eventually went into production in the Racal RA1772 family of HF receivers.

Cheers
David

And strict interpretation of the bill as I read, could ban almost any tuneable
receiver since it is very easy to build a converter for almost any frequency.
This would "modify" the receiver to be "capable of recieving" the prohibited
frequencies!

I'm starting a mailing list for Kenwood TH-78A owners. At first, it
will be handled manually. If you want to get on the list, please
send me your e-mail address, full name, and TH-78A serial number. Because
I'm doing this manually, I can only accept actual owners at this time.
If anyone has the time and capability to set up an automated server,
please let me know.

For submissions to the mailing list, just send me e-mail and indicate
in the subject line that you want it distributed.

Thanks...Joakim

1749. Repeater Replacement Question.

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 13:40:26 UTC
From: stigall@bronze.ucs.indiana.edu
Message-ID: <1992May1.134026.1755@bronze.ucs.indiana.edu>
Source record: 290376

Hello,

Here in Indiana we have decided to replace our old (pre 1971) RF deck
on our 146.04/64 repeater with something new. We have an SCOM 7K
controller which we like very much so we don't need anything with a
built-in controller, unless it's easy to disable. Some of the options
we are considering are:

1. MELCO (Maggiore) Hi Pro which would be easy to interface.
2. ICOM repeater which the interfacing problems are unknown.
3. Kenwood commercial repeater, also unknown interfacing.
4. Spectrum Communications rcvr/xmtr/power amp also easy to i-face.

Any comments about these options would be appreciated.

> Thanks in advance.

LL Grace usually has a full page ad in The Amsat Journal, also in QEX
the ARRL's monthly Experimenters Exchange magazine. They also advertize
occasionally in QST. They are a small outfit and you can reach them by
phone at 609-751-1018, 41 Acadia Drive, Voorhees, NJ 08043. Ask for
a data sheet. As far as I know, all sales are direct, there are no
US dealers however in other countries their products are carried by
dealers (for instance in the UK I have seen ads in the RSGB's Radio
Communications Magazine). It is no more aimed at EE's than the DSP2232
- if you just want to plug it in and use the provided built in features
then fine. If you want to add new functions you can do that too, but
be warned this is a major project requiring extensive assembly language
programming knowledge in both v40 (=8086) and 56000 languages AND an
understanding of DSP. I have no doubt that when the AEA toolkit comes
out it will require a similar level of expertise.

To put it in perspective, I have been in the telecom business for 30 years
the last 20 of which I have done a lot of DSP, assembly language and
high level language. I think it is no trivial task to add a new mode
but it sure is challenging and exciting. I was inspired by a couple
of notes on the net in the last few days to look into implementing an
ACSSB transverter - it would be tricky but it could be done.

Buying something like this from a small company has advantages and
disadvantages. On the one hand, with a large company you have the
economies of scale and a greater likelihood that they will be in
business in the future, still supporting the program (net.flames.icom
excepted). On the other a small company is usually more approachable
and flexible in dealing with special requirements of customers. The
DSP-12 has been out for nearly 12 months now (I got mine over 6 months
ago) and the toolkit with source code and schematics has been available
from the beginning. Big companies don't usually like to give out stuff
like that unless pressed by competition.

Just a point of view from a satisied customer.

1752. Re: Grounding and lead in water

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 15:13:24 UTC
From: rogerm@hpfcso.FC.HP.COM
Message-ID: <103360082@hpfcso.FC.HP.COM>
Source record: 290279

About the only source of lead from water systems was from copper pipe soldered with lead/tin solder. Iron pipe was galvanized with zinc and contained no lead. Lead was however used for some drain plumbing and could cause problems from people who got their domestic water from wells. New plumbing codes require copper pipe to be soldered with lead free solder.
I have plastic pipe in my house and the state electrical inspector still required me to put a ground clamp on my plastic cold water pipe to pass inspection. I already had 2 8 foot grounding rods driven into the ground for my service entrance ground but that wasn't enough to keep him happy. HiHi.

I'm wanting to send digitally encoded data over the air. Typical
bit rate might be around 70KHz - 120KHz. Since I'm very new to this,
there are several questions that I need to know.

1) What is the best type of encoding to use? i.e. Manchester,
B8ZS, etc...

2) What's the best/easiest modulation method? i.e. FSK, QPSK, FM, etc...

3) What frequencies are legal to use for short distances? (about
100 yards max - just like a garage door opener)

4) What is the power level needed to do the above at the rated freq?

5) What are some semi-counductors that would do the above?

6) Any other points that I have overlooked or might overlook?

Thanks in advance... PLEASE e-mail to the address below. I have
rare opportunities to get these news groups.

My brother might be going to Angola Africa for 6-12 months starting in September to work (very low pay) for ADRA (Adventist Development and Relief Agency). My question is what would he need in terms of a FCC license and foreign permits to be able to operate on the Ham bands to communicate back to the US using voice? He currently has no FCC license. What ham bands would be best? Any recommendations for the minimum equipment needed (must be cheap, reliable and reasonably portable)? About how long would it take to get the proper permits and who would one contact for them?

Please send your replies via Email.

(Signature deleted)

My perusal of old QST's, a fine magazine that it is, provides
and additional reason to be careful in making comparisons -
change in testing equipment and its limitations.
While Dave has first hand knowledge of the test setup and its evolution
over time, my knowledge comes from reading old reviews carefully
(and sometimes between the lines too). The numbers in the product
review are a function of the test equipment and the radios. They
both have changed over time. Consider, for instance, the measurement
of dynamic range. If I have read between the lines carefully, the equipment
in the early 70's could measure dynamic range upto 120db. The Drake
TR7 tested then had its dynamic range listed at 120db. The equipment
that ARRL uses today seems more capable (unless they have been
manufacturing the numbers :) :)). So if the Drake TR7 had been
tested with today's equipment when it was new (an impossibility
unless you can travel faster than light) the results may have been
even more impressive.

BTW, I do not own a DRAKE TR7 nor do I have any financial interest
in Drake.

ZCZC AP26
QST de W1AW
Propagation Forecast Bulletin 18 ARLP018
>From Tad Cook, KT7H
Seattle, WA May 2, 1992
To all radio amateurs

SB PROP ARL ARLP018
ARLP018 Propagation de KT7H

Solar activity continues its downward spiral. Last week this bulletin predicted a near term solar flux low of 160 around May 7. But instead the flux dropped below 130 over the past week, which is the lowest it has been since it hit 128 two years ago on May 5, 1990. This low activity resulted in unspectacular ionospheric propagation.

What little flare occurrence we had was hardly disruptive. The Boulder A index only went as high as 10 on the 24th and 25th.

The 90 day average for the solar flux is around 190, and the daily flux numbers should continue below the moving 90 day average until after May 10.

10 meters won't be much good for worldwide communications over the next week. Based upon the central U.S., 20 meters should be open to Europe best before sunset. To Japan, 15 meters should be best before sunset, with 20 meters best from very late in the evening until sunrise, 40 meters best around sunrise, and 80 meters best just before sunrise. To South America, 80, 40 and 30 meters should be open all night, and 20 meters will be best from before sunset to late in the evening.

Sunspot Numbers from April 24 through 30 were 198, 209, 191, 137, 152, 163 and 131, with a mean of 168.7. 10.7 cm solar flux for the same period was 160.9, 153.8, 143.2, 137.2, 128.5, 130.5 and 127.9, with a mean of 140.3.

Seth, how about having him drop his mast from 10 feet (really, a rather unmanageable length anyway) to, say, 4 feet. I used to run an 8-element 6 meter yagi using chimney straps on a brick chimney without the slightest problem using only a 3-foot mast. Worked fine, and it was up there for years and years.

DX Bulletin 22 ARLD022
>From ARRL Headquarters
Newington CT May 1, 1992
To all radio amateurs

SB DX ARL ARLD022
ARLD022 DX news

Thanks to Bob, W5KNE, and QRZ DX for the following DX information.

BURKINO FASO. Peter, XT2BW, is the only active station from Burkino Faso. His assignment is until December 1992, although a six to twelve month extension may be in the works. Listen for him on 40 through 10 meters, including the WARC bands. QSLs to WB2YQH.

CRETE. SV1AHH/SV9 will be active through May 3 on 20 through 10 meters, with an emphasis on RTTY.

CHINA. Operators at the Nanjing Institute of Technology club station BY4WNG, have built a TNC. DXers and tech wizards may check out a description of the TNC which is available on the VS6UF-1 BBS on 21111 kHz.

MICRONESIA. Barry, WC5N, will be active between May 2 and 9 as V63BW. Check 20, 17, 15, 12 and 10 meters for this mostly CW operation. QSLs to W5EW.

M-V ISLAND. An all band/mode operation by a team led by UT4UZ is reportedly in the works for May 21 through June 16. Keep an eye on the Cluster for this one.

FALKLAND ISLAND. VP8s signing /92HY are celebrating Heritage Year.

UGANDA. The 5X5CW operation planned by John PA3CXC, has been put on hold due to hostilities in the region.

IOTA NEWS. Here are some of the recent offerings for IOTA Hunters,
4K4, Dickson, AS-005
TM5, Pilier, EU-064
LU/D, Martin Garcia, SA-055,
KL7CYL, Kodiak, NA-019,

CT1CBI/P Baleal, EU-040,
V73EU, Majuro, OC-029, and
SV8/SM0TXM, Paros, EU-067.

CRYSTAL BALL. Some goodies that are active now or planned
for the near future include G4SMC/8R1 until May 20, 4U7ITU
until May 3, and 8Q7 by a group of JA operators until May
6.

NORTH KOREA. Avoid the rumor mill. Stay tuned to W1AW DX
Bulletins on HF and various BBS services for the official
word.

1759. PC-TRACK.

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 17:39:42 UTC
From: mdc@vixen.uucp
Message-ID: <1992May1.173942.5776@porthos.cc.bellcore.com>
Source record: 290286
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

Is PC-TRACK (PCT214 or PCT214.zip) available any place but
WSMR-SIMTEL20.Army.Mil? I have a problem trying to get in there.

Maybe if I had the node number (I think it was 76.2.??.0) this
machine might be kind and find SIMTEL20. Also wasn't there some things
that had to be done ("binary" or something) to get a good
transfer to a UNIX system?

e-mail please because I sometimes am a week or two before
I can get time to sift thru a number of messages.

Thanks

Mark,
Just had a thought. Don't know about Honda but my Toyota truck will
accept several types or manufacturers of spark plugs. One of these
plug types include a built in resistor to cut down on ignition noise.
You may have had resistive type of plugs in your car in the beginning,
maybe your mechanic replaced with a non resistive type of plug.
Check your owners manual, if in question, call a parts house......
For what it's worth.....WB6LPJ

1761. Re: 2 meter ACSSB, Anyone ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 18:35:36 UTC
From: rkarlqu@hpscit.sc.hp.com
Message-ID: <50030005@hpscit.sc.hp.com>
Source record: 290288

If ACSSB is so great, then why did they decide NOT to use it on the new 220 MHz. UPS system. They told the FCC that they needed to rip off our band to establish a new technology, ACSSB, and now that they have the band, they have gone back to FM. Anyone know the scoop on this?

> AA0ET
> ----------

A VSWR of 5.67 could represent an impedance as low as 50 divided by 5.67 or 8.82 ohms. 10 watts into this load would require a current of 1 amp. On the other hand, normal operation at 100 watts into 50 ohms (VSWR=1) would require 1.4 amps. So you are actually getting close to the rated output current. Since the efficiency will be far lower with the 8.82 ohm load than the 50 ohm load, it is reasonable to have to derate the current limit somewhat to keep dissipation within limits. Note that the VSWR detector is not smart enough to know whether the VSWR=5.67 represents an 8.82 ohm load or a 283.50 ohm load (or a reactive load for that matter), so it has to be designed for the worst case.

1763. RESULT: rec.radio.broadcasting passes 234: 34

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 19:49:03 UTC
From: wdp@gagme.chi.il.us
Message-ID: <1992May1.194903.16241@uunet.uu.net>
Source record: 290290
Cross-posted to: news.announce.newgroups,news.groups,rec.radio.noncomm,rec.radio.shortwave,rec.radio.amateur.misc
Body handling: HTML body converted to readable text

Voting on the proposed creation of rec.radio.broadcasting has
ended as of 4/30/92. The proposal received 234 yes votes
to 34 no votes, thus satisfying the Usenet criteria of both a 2/3
majority and 100 more yes votes than no votes, required for the
creation of this forum.

There were a few duplicate yes votes, which have been removed, no
switched votes, and a couple of no votes which did not strictly comply
with the voting guidelines, but were included anyway since intent
seemed clear.

CHARTER: Rec.radio broadcasting is intended as a worldwide forum
dedicated to discussion of subjects pertaining to 'domestic' radio
broadcasting. By the term 'domestic', we mean radio which is intended
basically for reception within the country from which it originates.
In other words any and all broadcasting which is not primarily intended for
reception in other countries/continents.

Valid subjects might include (but not be limited to) ...

* Technical and engineering matters
* Programming and formats (such as.. but not limited to..)
* Music and entertainment
* News & talk shows
* Political coverage
* Specialized formats
* Legislation and regulations affecting the medium
* Technologies affecting the medium
* Ideas for improving radio broadcasting
* Differences and similatrities between nation's broadcast services
* Low-power radio broadcasting
* Community broadcast radio
* Pirate broadcasting
* Broadcast DX
* Radio's historical & cultural significance
* Information exchanges for those seeking employment in radio.
* Shop talk, gabfesting and general communications between broadcast
professionals, hopefuls and listeners across the globe!

About the only traffic which is NOT welcome on this group is..

Flames and endless arguments over personal tastes in music/programming.
Unwarranted and excessive profanity and/or personal attacks.
Articles not pertaining to radio broadcasting. (*)

Articles about two-way, cellular, or other non-broadcast radio services,
unless they directly relate TO broadcasting. (*)

(*) - except matters of urgency to computer users, the public at-large,
or other matters of great impact or importance.

While this WILL be a moderated forum, I will restate that I believe in
minimal moderation and _NO_ censorhip! This means I will not kill any
incoming articles because they clash with some personal opinion or
belief. In other words, the ONLY reasons that an article might be killed
is if it falls into one of the above categories, or if it is one of
many identical responses to a posters question. In the latter
case, I would post a few of the identical responses and e-mail the remainder
to the poster requesting the information, giving a credit line to those who
posted, but were not printed. This is done to conserve net bandwidth.

So, without further adieu, here are the votes which came in over the past
month starting with the YES votes:

After the 5 day waiting period, baring and 'serious' objection,
rec.radio.broadcasting should be newgrouped and appear at your site.

If your site does not carry rec.* groups, contact me for information
on direct posting, and possible e-mail distribution.

My e-mail address is wdp@airwaves.chi.il.us (William Pfeiffer)

Thanks to all who participated.

William

1764. Curtis Keyer IC

1765. Looking for oscilloscope

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 21:01:23 UTC
From: darnold@felix.filenet.com
Message-ID: <17568@fritz.filenet.com>
Source record: 290292

I don't know anything about oscilloscopes, and little about electronics.
Could somebody recommend a good oscilloscope for a new amateur?

I would consider new or used. If used, please recommend one that is
readily available.

Is there such a thing as a Digital Oscilloscope that is actually a
board that will plug into my PC with software for viewing the
sampled waveform? If so, what is the product called, and where
can I get one.

Thank you.

Actually it was UPS (you know the clowns that won't even start looking
for your missing overnight package until it's been gone a week).

I think the real promise is spread spectrum. It's not so hard to do
and probably (if you can beleive Qualcomm's marketing) will result in
more users per MegaHertz.

It's my experience from putzing around with old equipment that it isn't age that kills these electrolytics, it's lack of use. I've got tube gear that's worked continuously for years. However, taking something out of mothballs and firing it up usually results in the caps failing within a few hours.

-Ron

Well, folks, I can hear the fat lady starting to tune up out on Prince Kuhio beach...so that means it's time for me to be moving on...but before I bid aloha to the islands, I just wanted to say mahalo to all of you for almost four years of good times here on this group, and especially for helping to rekindle my interest in this great hobby/service and spurring me on to upgrade from Tech to Extra...and to add that I hope to be able to rejoin you from the ham mecca of North America, Dayton, Ohio...

73 es aloha,
Jeff Miller NH6ZW AFA8JM (coming soon: NH6ZW/N8 AFA1??)

(exiting slowly stage right, with "Aloha O'e" playing softly in the background)

Now we know why Fred volunteered for the tape creation for the callsign project - he has LOTS of spare time on his hands that he does not know what to do with :-) :-) :-) :-)

>TM-741A

I'm going to have to go visit Fred now and play games with his radios (gives new meaning to the expression "goofing around with my radios" :-)

I used to have a game mode similar to this on one of my watches (makes me wonder if their display controller is a big brother to that watch!).

The way to get points (on the watch, anyway) was to push the "fire" button when the rightmost display displays the same digit as the target.

I'd be interested to know if its the same game (and even MORE interested if it turns out that the game is truly run from the display controller (BIG assumption warning :-)).

ZCZC AP26
QST de W1AW
Propagation Forecast Bulletin 18 ARLP018
>From Tad Cook, KT7H, Seattle, WA
May 2, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP018
ARLP018 Propagation de KT7H

Solar activity continues its downward spiral. Last week
this bulletin predicted a near term solar flux low of 160
around May 7. But instead the flux dropped below 130 over
the past week, which is the lowest it has been since it
hit 128 two years ago on May 5, 1990. This low activity
resulted in unspectacular ionospheric propagation.

What little flare occurrence we had was hardly disruptive.
The Boulder A index only went as high as 10 on the 24th
and 25th.

The 90 day average for the solar flux is around 190, and
the daily flux numbers should continue below the moving 90
day average until after May 10.

10 meters won't be much good for worldwide communications
over the next week. Based upon the central U.S., 20
meters should be open to Europe best before sunset. To
Japan, 15 meters should be best before sunset, with 20
meters best from very late in the evening until sunrise,
40 meters best around sunrise, and 80 meters best just
before sunrise. To South America, 80, 40 and 30 meters
should be open all night, and 20 meters will be best from
before sunset to late in the evening.

Sunspot Numbers from April 24 through 30 were 198, 209,
191, 137, 152, 163 and 131, with a mean of 168.7. 10.7 cm
solar flux for the same period was 160.9, 153.8, 143.2,
137.2, 128.5, 130.5 and 127.9, with a mean of 140.3.

1773. Ham Radio Interference from Neighbor

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-01 22:58:33 UTC
From: remedios@hpindda.cup.hp.com
Message-ID: <100010009@hpindda.cup.hp.com>
Source record: 290300

I have a neighbor who operates a ham radio and I am getting
interference on my TV from it. I spoke to him about it and
he suggested my getting high pass filters for my TVs and my
VCRs. I did this but it did not help much. I spoke to him
again and he said that he is licensed and is operating under
the rules and regulations of the FCC. He said my only other
alternative would be to get cable TV. I do not wish to do
this. But even if I did, I am afraid that it may not solve
the problem because when I watch videos and disconnect the
outdoor antenna from my TV, I still get some interference
although not as bad as when I have the antenna attached.

Is there anything I can do besides getting cable that can
solve this problem?

Is there anything he can add to his equipment so it will not cause
so much interference? He says he uses low pass filters.

Thanks in advance,
Jim Remedios

Conventional electrolytic caps consist of a metal plate (usually aluminum) and a conductive liquid, or electrolyte, separated by an oxide layer on the aluminum. The oxide layer -- the capacitor's insulator -- is grown on the aluminum as a result of direct current flowing through the capacitor. A freshly-manufactured capacitor will have a lot of leakage current due to the lack of an oxide layer. As leakage current flows, the oxide will grow, which reduces the current. This process continues until the layer is thick enough to reduce the leakage current to a very small value. If voltage is continuously or periodically applied to the cap, any leakage current will grow more oxide until the current again drops to a low value. But if the capacitor sits around for a few years with no voltage applied, the oxide layer deteriorates. (I don't know the mechanism.) When voltage is then applied it's like a newly manufactured capacitor and heavy leakage current flows. This results in capacitor failure due to heat and/or gas generation. Old capacitors can be re-formed by applying a low voltage. The voltage is increased until a few mA of current flows. (The 1991 ARRL Handbook recommends 10 mA. I'd keep the current at a level to maintain a power dissipation of no more than a watt or so for a common-sized can.) Leave the voltage there until the current drops, then increase the voltage to bring the current back up. Continue until the full working voltage is applied. Take precautions appropriate for the possibility of an exploding capacitor. It would be a very good idea to use a current-limiting resistor in series with the supply. A fixed-voltage supply could be used and the current adjusted by gradually decreasing a series resistor.

Note that electrolytic capacitors will self-adjust their voltage rating to suit the applied voltage. If a 500 volt cap has 300 volts across it for a long time, the oxide layer will deteriorate so that the leakage current will be low at 300 volts but not at 500. If power supply repairs result in higher voltage being applied to the capacitors, you may need to re-form them by gently increasing the voltage from the old value to the new.

I can just imagine the Congress (opposite of progress) in their hurry to get this legislation out accidentally banning cellular telephone completely. If it's not legal to receive on those frequencies, then a cellphone obviously can't receive those frequencies. Or a cell site.

The possibilities for spectrum freeing are amazing!

:) :) :) (: (: (:

I suppose they will next outlaw buying/selling various combinations of capacitors/inductors/varactors that can be made into receivers for these frequencies? What after that??

This is merely part of a growing trend known as "government by litigation".
Goverment passes very vague laws so that hordes of lawyers and judges are
needed to interpret and set precedents. Eventually the law has enough
behind it to stand up in court, even if the law does not then mean what
was originally intended.

In other words, if you pay your lawyer(s) enough, the ECPA (or anything
else) can be used for whatever you want to use it for. A good place to
start would be with what is intended by "received" and "public use".
Public Service Bands for public use, right? The Police Bands are used
by the police, and they serve the public, don't they? Sure they do!

1784. Standard C528 rechargable battery mod

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-02 14:15:14 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1992May2.141514.4838@cbfsb.cb.att.com>
Source record: 290311

copied from packet:
(with some, but not all, grammer errors fixed :-))
Sb: STANDARD C528\520 BAT.MOD PT1.
From : GB7OMM @ GB7OMM.#34.GBR.EU

Hi All,
another mode from Elio IK4NYY.
I would like to thank him for the mod plus a very big Thanks to Steve's (G8SFR) Xyl Alison for retypeing out the mod for me into English.
This has been sent mainly as a guide and that i can not be of any help if you run into trouble, but i bet there are more tech minded people that can help you.

73 De Steve G0OMM @ GB7OMM.#34.GBR.EU

With this simple mod, you can upgrade your Standard C520/528 using rechargable batteries without having to spend a lot.
You will need to get 6 rechargeables of 600\700 mah, a resister of 33ohm 2 watt and two diodes of 1 amp type 1N4004.
Start by taking off the outside cover. Now to open the transceiver, you need to remove the small metal plate where you will find the battery pack held in place by 4 little screws, the cross-headed screws mounted laterally on the back.
It's all you have to do, the transceiver will open.
Carefully open the two parts holding together from the flat cable upon which half you should find the finger control/keyboard and a long wire approx 7 cms.
You can't miss it, it's the only wire there is.
Now, from the point where this is soldered onto the lower, bottom part of the transceiver, solder a small piece of wire about 3 or 4cms.
The other end should be soldered to the PCB where there is a large/fat/wide soldered little square (PCB Track?) which also cannot be missed tacking as orientation the connector from the external power supply: The said little square stands on its own and with this the mod on the inside of the apparatus are complete and can now recharge them

Now let us look at the battery pack (Model CBT 151).
Open the two parts and take out only that one where you see the sign + (positive).
Note where the first battery is, its positive pole resting on the little metallic tab(tongue) having the shape and the characteristics of a corner angle slipped off from its housing towards the top.
Do not worry, it is only fixed in and divides with cutters in the middle of the corner/angle.
Be careful when separating with the cutters, The two parts may tend to fall apart, thus, if you are not careful you can lose a piece.

If this happens, do not worry , but be very careful that this does not happen.
Take the smallest piece, namely that which is mounteed next to the + symbol and solder on top of the terminals the two diodes in series opposite in between, namely an anode and a cathode.
Mind that the pieces of the terminals are chromed metal, ie, on the point when you intend to solder the join, it is necessary you clean in a bit first with a thin sanding paper, solder it and try to slide it away; you can also help by using some soldering flux such as a deoxydising one.
Do this soldering, solder the diodes to the very edges of the resister (divie the leads furthest most extreme side k cathode diod-resistance).

Now remount the first piece on the capaciter moulded sockets of resistor of 33 ohms and diodes so that they can be fixed in the restricted space at the side of the first battery.
Also replace the other piece of the metal tab onto place and solder it on top of the terminal along the resister (on to which is attached :- A anode of the diode.
That is basically it.
One last thing, make absolutely sure that there exists no kind of electrical contact from the two metal tabs from your solders.
Mount on the battery carriers the six rechargeable batteries, check again the whole thing and connect on the switch of the external feeder/power supply a voltage of 10 to 12 volts and let the batteries charge up.
The apparatus can then work on batteries and with the power supply; When working with the latter, The batteries will just charge up, In spite of all the modification...
END......
++
Note: I haven"t tried or verified this, proceed at your own risk. WA2ISE

1785. callsign server update

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-02 14:16:12 UTC
From: bowen@acsu.buffalo.edu

If you are looking for used radios, most any larger hamfest will probably
have someone selling used police handhelds and such. But these will be
limited to at most about 6 frequencies (ie, crystals). They are durable.
If not a hamfest, and you are willing to spend $, call up the local 2 way
radio shop, and inquire.
I'm using a modified HT220 handie for my packet radio. This rig has an added
power amp to make 8W.

UNDERSTANDING THE DAILY SOLAR GEOPHYSICAL DATA BROADCAST
--------------------------------------------------------

Revision 1.01

The Solar Terrestrial Dispatch (STD) has been providing a daily
broadcast of solar geophysical indices and other data over the electronic
networks.

Computer software (in MSDOS format) to automatically extract the data in
these daily reports, archive it, and/or graphically analyze it, is available
through anonymous FTP or from our computer BBS system. For those with FTP
capabilities, you may obtain this software under the filename "BCAST101.ZIP"
from one of the following sites:

- solar.stanford.edu, in the "pub/Software" directory.
- nic.funet.fi, in the "pub/dx/software/msdos/solar" directory.
- wsmr-simtel20.army.mil, in the directory: "pd1:<msdos.database>"
- wuarchive.wustl.edu, in the directory: "mirrors/msdos/database"

The software may also be freely downloaded from our computer BBS system by
dialing: (403) 756-3008. You will find BCAST101.ZIP in the Utilities file
section of the BBS.

A sample broadcast message follows below. This sample broadcast data
set will be fully described in this document.

!!BEGIN!! (1.0) S.T.D. Solar Geophysical Data Broadcast for DAY 248, 09/05/91

LINE 01

!!BEGIN!! (1.0) S.T.D. Solar Geophysical Data Broadcast for DAY 248, 09/05/91

!!BEGIN!! : Signifies the start of the report, for computer-controlled
extraction of the data.

(1.0) : Represents the version number of the data set. The
appropriate software with the same version number must
be used to extract and interpret the data sets.

DAY 248 : The day of the year for the report.

09/05/91 : Equivalent Month/Day/Year of the report.

LINE 02

10.7 FLUX=164.5 90-AVG=206 SSN=204 BKI=5454 3323 BAI=025

10.7 FLUX=164.5 : The 10.7 cm solar radio flux as reported by the
NRC-Dominion Radio Astrophysical Observatory (DRAO) in
Penticton, British Columbia, Canada (formerly produced
by the Algonquin Radio Observatory in Ottawa).

90-AVG=206 : This value represents the 90-day average 10.7 cm solar
radio flux.

SSN=204 : This value is the observed sunspot number as observed by
Mt. Wilson Solar Observatory and reported by NOAA.

BKI=5454 3323 : These digits represent the 8 three-hourly Boulder K-indices
as observed by the Boulder USGS magnetometer. The first
digit represents the observed K-index for the period from
00:00 UT to 02:59 UT. The second digit represents the
observed K-index from 03:00 to 05:59 UT, and so forth.
If data is unavailable, it is replaced with an asterisk.

BAI=025 : This value is the observed 24:00 UT Boulder A-Index for
Boulder, Colorado.

LINE 03

BGND-XRAY=B8.6 FLU1=2.7E+05 FLU10=8.3E+03 PKI=5454 4333 PAI=029

BGND-XRAY=B8.6 : This is the background x-ray flux value as reported by the
Space Environment Laboratories. This value is produced by
observing the background x-ray emissions in the soft-xray
band (1 to 8 Angstroms). Consult the "Glossary of Solar
Terrestrial Terms" as produced by the STD for information
on understanding the x-ray classification scheme. This
document is available for anonymous FTP from the site:
"solar.stanford.edu" in "/pub", or on "nic.funet.fi".

FLU1=2.7E+05 : This value is the observed proton fluence at greater than
1 MeV (million electron volts).

FLU10=8.3E+03 : This is the observed proton fluence at greater than 10 MeV.

PKI=5454 4333 : These digits represent the 8 three-hourly estimated
planetary K-index values for the UT day. The format is
the same as is used for the Boulder K-indices noted above.

PAI=029 : This value represents the estimated planetary A-index value
for the UT day. Occassionally, this value is not available
at the time the data set is compiled. If this is the case,
a preliminary calculation is made to estimate the planetary
A-index value using the planetary K-indices. Although this
will not produce an officially accurate result, the results
calculated in this way are usually accurate to +/- 2 points.

LINE 04

BOU-DEV=093,051,073,060,023,030,012,021 DEV-AVG=045 NT SWF=05:079

BOU-DEV=093,051,073,060,023,030,012,021
These values represent the observed maximum deviation in
the Boulder USGS magnetometer. The values are in nano-
tesla (nT, or reported as "NT" elsewhere in the report).
The first value represents the observed maximum deviation
of the geomagnetic field (using the most disturbed magnetic
component) during the period 00:00 UT to 02:59 UT. In this
example, the maximum deviation observed was 93 nT between
00:00 UT and 02:59 UT. The second value represents the
maximum deviation between 03:00 UT and 05:59 UT. Each of
these values correspond to the observed Boulder K-index
as reported on line 2 of this daily report.

DEV-AVG=045 NT : This value represents the average daily maximum deviation
of the Boulder magnetometer, given in units of nanotesla
(or NT). It is produced by simply averaging the 8
three-hourly maximum deviation values given on this line.

SWF=05:79 : The first value (05) represents the number of possible
episodes of Short Wave Fades (SWFs) observed during the
UT day. Short wave fading is simply a period of time when
the absorption of High Frequency (HF) radio waves increases
which produces a decrease in signal strengths of HF signals
OVER SUNLIT AREAS. In other words, this value represents
the approximate maximum number of times HF signals may have
faded out during the UT day. It is important to note that
SWFs are the strongest over the low and middle latitudes
and are ONLY observed during the daylight hours, preferably
when the sun is higher in the sky.

The second value (79) represents the estimated maximum
number of minutes that solar-flare activity may have
produced observed SWFs. In this example, solar activity
may have produced observed SWFs as many as five times
during the UT day. The estimated maximum number of

minutes that signals may have been degraded was 79.

Please note that these values are estimated maximums.
It is important to remember that most regions of the world
are in darkness for many hours each UT day. During periods
of darkness, SWFs will not be observed. Therefore, these
values are most useful as indicators of the possible
ionospheric disturbances which may have occurred during
the daytime hours. Days with 00 episodes of SWF activity
denote low levels of daytime sporadic HF signal absorption.

LINE 05

XRAY-MAX= M4.4 @ 0111UT XRAY-MIN= B8.0 @ 0914UT XRAY-AVG= C2.5

XRAY-MAX= M4.4 @ 0111UT
This value represents the maximum observed X-ray level
during the UT day, as well as the time of its occurrence.
In this example, x-rays during this UT day peaked at a
class M4.4 level at 01:11 UT.

XRAY-MIN= B8.0 @0914UT
This section of the report represents the minimum observed
x-ray level during the UT day. Same format as the maximum.

XRAY-AVG= C2.5 : This value represents the average x-ray flux observed
during the UT day. This value is determined by averaging
all of the 1-minute x-ray values during the UT day. This
average value might not always be determined by a full set
of one-minute daily values. If data from the GOES
spacecraft supplying this information is temporarily
halted, this value will be calculated from those daily
one-minute values which are received. It is therefore
possible, (although extremely unlikely) that this average
value may be produced from only one or two one-minute flux
measurements.

It is important to distinguish the difference between the
background x-ray flux and the average x-ray flux. The
average x-ray flux is the actual numerical average of all
daily x-ray bursts (including all x-ray flares). The
background x-ray flux is the lowest stable x-ray level
observed during the day which is not associated with x-ray
bursts. The x-ray average will therefore almost always be
higher than the background x-ray flux. In this example,
the average x-ray flux is a fair bit higher than the
background level, possibly due to a number of x-ray bursts
which occurred during the UT day.

LINE 06

NEUTN-MAX= +003% @ 2250UT NEUTN-MIN= -002% @ 1700UT NEUTN-AVG= +0.5%

NEUTN-MAX= +003% @ 2250UT
This is the maximum observed neutron monitor count as
observed by the Thule neutron monitor. It indicates a
maximum observed value of 3% which occurred at 22:50 UT.
Significant maximums of greater than 10% may be related to
Ground Level Events (GLEs) which are associated with near-
relativistic particle bombardments from major solar flares.
These neutron monitor values are determined by examining
the 5-minute averages of the neutron monitor count rates.

NEUTN-MIN= -002% @ 1700 UT
This is the observed minimum neutron monitor count as
measured by the Thule neutron monitor. Values below
-5% may be related to Forbush decreases (FDs) which are
most often associated with strong geomagnetic disturbances.

NEUTN-AVG= +0.5%: This value represents the average neutron monitor count as
observed by the Thule neutron monitor. Average values
below -5.0% are associated with Forbush decreases.

LINE 07

PCA-MAX= +0.7DB @ 1425UT PCA-MIN= -0.2DB @ 2325UT PCA-AVG= -0.1DB

PCA-MAX= +0.7DB @ 1425UT
This section shows the maximum Polar Cap Absorption (PCA)
level observed during the UT day by the Thule T30A
Riometer. Positive values indicate elevated levels of
ionospheric absorption over the polar regions. As a
result, positive values (particularly in excess of about
1.0 to 2.0 dB) are sufficient to cause notable attenuation
of HF signals over or near the polar regions. Values
larger than 3.0 to 4.0 dB may cause heavy to complete
absorption of HF radio signals over the polar and possibly
some high latitude signal paths. Riometer values less than
or equal to 0.0 dB are associated with negligable
absorption levels over the polar regions. Note that small
levels of absorption (of only a few tenths of a dB) may be
sufficient to cause errors in navigational signals such as
OMEGA navigational signals traversing the polar regions.

PCA-MIN= -0.2DB @ 2325UT
This is the minimum PCA level observed during the UT day.

PCA-AVG= -0.1DB : This is the average PCA level observed during the UT day
and is calculated by averaging the 5-minute averaged
riometer measurements during the UT day.

LINE 08

BOUTF-MAX=55331NT @ 2250UT BOUTF-MIN=55263NT @ 1649UT BOUTF-AVG=55301NT

BOUTF-MAX=55331NT @ 2250UT
This is the maximum observed value of the Total magnetic
Field (TF). The total field value is calculated by using
all three orthogonal components of the geomagnetic field.
These values are valid for Boulder, Colorado. The field
values are in units of nanotesla (NT). The time of the
maximum is also indicated.

BOUTF-MIN=55263NT @ 1649UT
This is the minimum observed value of the total field at
Boulder, Colorado.

BOUTF-AVG=55301NT
This is the daily average of the total magnetic field
strength as observed at Boulder for the UT day.

LINES 09 & 10

GOES7-MAX=E:+113NT@ 0607UT GOES7-MIN=N:-052NT@ 0911UT G7-AVG=+067,+063,+002
GOES6-MAX=P:+101NT@ 1925UT GOES6-MIN=N:-010NT@ 1439UT G6-AVG=+073,+026,+014

These two lines report the maximum, minimum and observed
average values of the geomagnetic field at geosynchronous
altitudes as observed by the GOES-6 and GOES-7 spacecraft.
GOES-7 is the primary spacecraft and is therefore reported
first.

The first capital letter following the "GOES7-MAX="
statement indicates which component of the magnetic field
experienced the maximum value observed during the UT day.
There are three possible letters which may be used here,
representing one of the three possible magnetic components:
P = The component parallel to the Earths rotation
axis. Positive values are northward. Negative
values are southward.
E = This is the Earthward component. Positive
values represent a downwardly directed field
(ex. toward the Earth or Earthward).
N = This component is perpendicular to the other
two. Positive values represent a westwardly
directed field. Negative values are eastward.
The figure following the "P:", "E:", or "N:" is the
observed magnitude of that component, followed by the time
that the value was observed. In this example, the GOES-7
spacecraft Earthward magnetic component was the observed
maximum component during the UT day. The magnitude of this
maximum Earthward component was +113 nanoteslas. This
represents a downwardly directed magnetic field with a
strength of 113 nT. GOES-7 observed this max at 06:07 UT.

This same format is followed for the minimum values
observed on GOES-7 as well as for the values on GOES-6.

G7-AVG=+067,+063,+002
This line reports the average geomagnetic field strengths
for the three magnetic components of the GOES-7 spacecraft.
The first value will ALWAYS represent the Parallel magnetic
component. The second value will ALWAYS represent the
Earthward magnetic component. And the last value will
ALWAYS represent the Perpendicular component. So in this
example, the average daily magnetic field strength for the
parallel component was +67 nT. The Earthward component had
an average field strength value of +63 nT while the
perpendicular component had an average value of +2 nT.

This same format is followed for the average values of the
GOES-6 secondary spacecraft.

LINE 11

FLUXFCST=STD:160,157,155 ; SESC:160,155,150 BAI/PAI-FCST=15,10,10 / 15,15,18

FLUXFCST=STD:160,157,155 ; SESC:160,155,150
The first three values represent the 72-hour forecast
10.7 cm solar radio flux values as produced by the Solar
Terrestrial Dispatch (STD). The second group of three
values are the 72-hour 10.7 cm solar radio flux forecast
values as issued by the Space Environment Services Center.
If either of these two forecasts are unavailable, "N/A"
will be used in place of the digits.

BAI/PAI-FCST=15,10,10 / 15,15,18
The first group of three values represent the 72-hour
forecast Boulder A-Index (BAI) values as issued by the
Space Environment Services Center. The second group of
three digits represent the 72-hour forecast Planetary
A-Index values (PAI) as issued by the United States Air
Force (USAF) Global Weather Central.

LINE 12

KFCST=3344 5433 2334 4211 27DAY-AP=019,011 27DAY-KP=2333 4333 2233 2322

KFCST=3344 5433 2334 4211
These digits represent the 48-hour K-index fourcasts as
released by the Space Environment Services Center. The
first value represents the forecast K-index value for 00:00
to 02:59 UT. The second value represents the forecast K-
index value from 03:00 UT to 05:59 UT, etc. The sixteen
digits define the expected K-indices for the next 48 hours.

27DAY-AP=019,011: These values are the historical estimated planetary A-index values that were observed 27 days ago (approximately one solar rotation). The first value represents the observed estimated planetary A-index value 27 days ago. The second value represents the value observed 26 days ago. These two values may help serve as a guide to the possible intensity of recurrent geomagnetic phenomena.

27DAY-KP=2333 4333 2233 2322
These digits are the estimated planetary K-index values that were observed 27 days ago. The first group of eight digits (2333 4333) represent the three-hourly planetary K-indices that were observed 27 days ago. The second group of eight digits (2233 2322) represent the K-index values that were observed 26 days ago.

LINE 13, 14...

WARNINGS=*MAJFLR;*PROTON
ALERTS=**MAJFLR:X1.1/2B,N20E29(6857),0523-0555-0641,II=2@0551,IV=3@0602;
MINFLR:M4.4@0111;MINFLR:M2.3@0528;**MINFLR:M1.6@1209;
**TENFLR:2200,DUR:N/A

These lines summarize the Warnings and Alerts which are active at the end of the UT day. Each warning category is prepended with a SINGLE asterisk. Each alert category is prepended with DOUBLE asterisks. The end of each warning and alert is appended with a semicolon if more warnings follow. If no warnings follow, a carriage return concludes the category. Warnings and alerts may span several lines. These WARNINGS are valid:

*MAJFLR = Potential Major Flare Warning
*PROTON = Potential Satellite Proton Event Warning
*PROTFLR = Potential Proton Flare Warning
*GSTRM = Potential Geomagnetic Storm Warning
*MSTRM = Potential Minor Geomagnetic Storm
*JSTRM = Potential Major-Severe Geomagnetic Storm
*AURMIDWCH= Middle Latitude Auroral Activity WATCH
*AURMIDWRN= Middle Latitude Auroral Activity WARNING
*AURLOWWCH= Low Latitude Auroral Activity WATCH
*AURLOWWRN= Low Latitude Auroral Activity WARNING
*PCA = Potential Polar Cap Absorption Event Warning

The following ALERTS are valid:

**MAJFLR = Major Solar Flare Alert
**MINFLR = Minor Solar Flare Alert
**MINSTRM = Minor Geomagnetic Storm Alert
**MAJSTRM = Major Geomagnetic Storm Alert
**SVRSTRM = Severe Geomagnetic Storm Alert
**PCA = Polar Cap Absorption Event Alert
**PCAENH = Polar Cap Absorption Enhancement Alert
**PROTN10 = Satellite Proton Event Alert at > 10 MeV

**PROTN100= Satellite Proton Event Alert at > 100 MeV
**PROTNENH= Satellite Proton Enhancment Alert at > 10 MeV
**MAGSI = Magnetic Sudden Impulse Alert
**245STRM = 245 MHz Radio Noise Storm Alert
**TENFLR = Tenflare Alert
**SWEEP = Sweep Frequency Event Alert
**FORBUSH = Forbush Decrease Event Alert
**GLE = Ground Level Event Alert

Each of the alerts may be followed by a colon and very terse descriptive text describing parameters of the event. For example, the alert section within this example reads:

ALERTS=**MAJFLR:X1.1/2B,N20E29(6857),0523-0555-0641,II=2@0551,IV=3@0602;
MINFLR:M4.4@0111;MINFLR:M2.3@0528;**MINFLR:M1.6@1209;
**TENFLR:2200,DUR:N/A

This line consists of FIVE alerts (each set of double asterisks denotes the start of a new alert): One major flare alert, three Minor Solar Flare alerts and a Tenflare alert. In this example, the major flare was a class X1.1/2B event located at N20E29 within Region 6857. It began at 05:23 UT, peaked at 05:55 UT and ended at 06:41 UT and was associated with a Type II sweep (importance 2) at 05:51 UT and a Type IV sweep (importance 3) at 06:02 UT. If a tenflare would have been associated with this event, it would have been treated as a separate alert with a time corresponding to the time of the major flare. In this ficticious example, no tenflare was observed.

The first minor solar flare was a class M4.4 which occurred at 01:11 UT. The second was a class M2.3 at 05:28 UT. The third was a class M1.6 at 12:09 UT and the Tenflare was observed at 22:00 UT. The DURation of the tenflare was unknown (not available) at the time the report was compiled.

Notice that the last alert is not followed by a semicolon. This marks the end of the alert section.

LAST LINE

!!END-DATA!! : The last line of the daily report will ALWAYS contain this final statement, which signifies the end of the data set.

FINAL NOTES

Additional warnings and alerts may be added to those mentioned here. The format of this data set may also change over time. Data may be added or deleted from the existing data set. However, for the most part, the structure will remain the same. Comments may be appended to the message following the dataset (ex. following the !!END-DATA!! marker), although this will not be a common practice. The length of the daily data set should be approximately 15-16 lines, but may vary slightly depending on the number of warnings and alerts that are active during each day.

This is the same data set that is sent to other organizations and institutions for research or professional purposes. Individuals or organizations with a need to directly receive this data through email should send requests for placement on the mailing list to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. Only those with a professional need, or those who receive the data too late to be of value, are encouraged to request direct access to the mailing list.

There may be infrequent days when no data sets are broadcast. This may be due to local computer problems, or perhaps possible problems with sites forwarding the data sets through the nets. In most circumstances, the data sets should arrive daily. They are usually released once a day, sometime after approximately 02:00 to 03:00 UT. This time lag into the new UT day is required so that all of the data associated with the previous UT day may be collected and processed for inclusion with the daily data set.

1790. Re: Fluke 97 Scopemeter, any comments on them?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-02 20:13:56 UTC

Cross-posted to: rec.ham-radio,rec.radio.amateur.misc,sci.electronics

well, I had the Fluke rep. come down to my office & give a demo. I'd been screwing around with this piece of crap Beckman Industrial calls a scope for the last 2 hours trying to get a decent reading on a nonlinear capacitive discharge. Fluke guy walks in & tries to show me his "look at the nice sine wave demo". Boring. Stop says I, plug it into this. Okay says he. I press the AutoSetup button and bingo: one perfect reading to go. I started to jot down the readings in my notebook when he just plugged the 97 into my the HP on my desk. Initial connect to hardcopy: less than 5 minutes. I ordered one on the spot.
That was back in December: still haven't got it. Fluke is backordered up the wazoo. They say May 15th. According to the Fluke rep, software bugs aren't the major concern for the 97 that they usually are for most embedded systems: he says that the entire firmware (about a megabyte) resides in nonvolatile ram. Bug fixes can be downloaded to the client through the serial port. Excellent move. Made me feel comfortable ordering a revision 1.00 unit.

Does anyone have any info on this HT? Particularly mods and not obvious features. I purchased two of them and want to know what others think. Thanks.

One assumes that Jon Biddell and others who hold RS in such low regard will cease doing business with them, and we will see an end of the diatribes on this net.

73,
Dube Todd AB5AP <dube@cpdvax.csc.ti.com>

1793. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-03 00:05:46 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <1992May3.000546.1467@afit.af.mil>
Source record: 290320

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods, plus signs = 0; minus signs = 1)

Line 2
Column Description

01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6

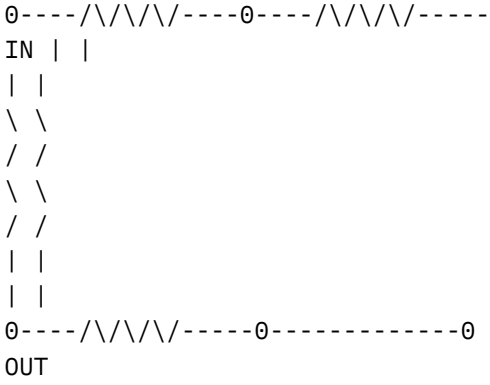
I am going through the painful task right now of learning some more electrical fundamentals than just plugging parts into pc boards. In order to accomplish this ... MIRICLE ... I found a copy of the ARRL handbook for Radio Amateurs. So far I've pretty much understood everything except for one problem. When you are calculating resistances or capacitances in series or parallel it gives you really nifty formulas to do so. But the problem I have is what do to do when they are in both, parallel and series? (see fig. below) If there are any circuit designers out there who have a clue about this, Id like to know. I haven't taken any electronics classes, im an accounting major and cant fit them in, and would rather not if I can learn the stuff on my own. Thanks for the help.



Rob

A Brief Historical Overview:
++++++++++++++++++++++++++

If there is any one constant in the changing state of the communications art, it is that "Hams" (Amateur Radio Operators) have always been on the forefront of it. Rumors abound where the term "Ham" came from. Some of the more amusing are described at the end of this article.

Regardless of origin of the name, a "Ham" is universally recognizable as one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream such as was the case with Edwin Armstrong, who developed the regenerative oscillator and FM radio, or General Curtis LeMay (W6EZV) who was instrumental in making Single-Sideband the communications standard for the Strategic Air Command and eventually the U.S. Air Force. Although packet-switching techniques originated from DARPA (Defense Advanced Research Projects Agency) and the ARPANet, no one can deny the tremendous influence that amateurs have had in demonstrating the viability of TCP/IP and AX.25 communications via radio links. The efforts of AMSAT (the Amateur Satellite Corporation) including the development of many ham satellites and the low-orbiting Microsats (communications satellites no bigger than a breadbox that use store-and forward packet techniques) have certainly advanced the state-of-the-art in communications, one of the defined purposes of the Amateur Radio Service, as recognized by international treaty.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay

of amateur radio, and the source of many new hams, particularly those interested in working on emerging technologies.

Even more importantly, Elmers provided an outlet for the impatient newcomer who wanted "to know everything, and right away." Faced with such a request, a good Elmer will smile and proceed to lead the novice through some project or operating experience. Several hours, days, or weeks later, the novice would have his answers, but would have earned them. Even better, the sense of accomplishment would boost the novice's confidence and nudge him or her down the road to being a model, experienced ham operator.

Many present hams feel that such an experience is missing today. In today's hustle-bustle world, the response to such natural curiosity and desire to learn is, more often than not, "I'm too busy" or "RTFM." As a result, the quality of new hams declines and the knowledge and operating habits they develop in their first formative months and years leave much to be desired. And the very same hams who claim that they "can't understand the new generation" also, in almost the same breath, lament about the "decline of amateur radio."

What is an Elmer today?
++++++++++++++++++++++

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?
++++++++++++++++++++++

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their knowledge to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise.

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO, Educational Services Manager at the American Radio Relay League, 225 Main St., Newington, CT 06111 or via electronic mail addressed to rwhite%arrlhq.uucp@uhasun.hartford.edu.

The latest version of the list can be found in the companion posting to this message, "Amateur Radio Elmers Resource Directory." If you sent me mail and are not on it, please resend as it may have been lost on the way or once it reached my host, or I am waiting on further revisions to your entry (with the list's increasing size, I like to keep the entries as descriptive as possible).

(Note to readers of Info-Hams Digest: Because of its size, the companion list is not (yet) sent via the mailing list. The latest copy

can be obtained via anonymous FTP or FTP mail server from ftp.cs.buffalo.edu under file ~/pub/ham-radio/elmers_list.)

Currently, the list is over 40 Elmers strong, is cross-posted to the news.answers newsgroup, and has become an invaluable resource for many, as well as an opportunity for the volunteers to share their knowledge. Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

73, Paul W. Schleck, KD3FU

pschleck@odin.unomaha.edu
pschleck@acm.unomaha.edu

* Possible origins of the word HAM:

The acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initals of the founder of the American Radio Relay League, Hiram Maxim, W1AW (his actual middle name being Percy apparently notwithstanding) or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT)

(Dale Mosby, N7PEX, offers the explanation that HAM must stand for "Hardly Any Money," considering the investment one could make in the hobby.)

Knowledgable individuals from the American Radio Relay League (ARRL), and other radio historians, seem to agree that the terms "Ham" and "Lid" (an inept operator) both originated with landline telegraphy. A "Ham" was a show-off and a "Lid" was a telegraph operator so inexperienced, he had to use a pot or can lid to rest his telegraph sounder on to properly copy the code.

As an interesting historical footnote, early telegraph operators may have been the first to experience the infamous curse of our communications age, Repetitive Stress (or "Carpal Tunnel") Syndrome (called "Glass Arm" in those days, which encouraged the invention of the semi-automatic or "bug" key).

++

Jay Appell --> KA1SNA

1976-1978 FCC Personal Users Radio Advisory Committee
Task force for Rules Rewrite Citizens Radio Service
Rules interpretation

1990-Current Consultant to Alinco Electronics

Currently work for Stratus Computers/Technical Support Engineering

Address: Jay_Appell@cac.stratus.com
Telephone: 1-800-458-0042 X2548

I enjoy Amtor, RTTY, and SCA reception.

I have considered putting together a DSQ primer booklet for those interested in DSQ only. If I receive enough response I will consider the project.

If you would like to leave me mail by modem, use the BBS 1 Hopedale Center at 508-478-6969. This is a new amateur BBS running from 7AM to 7PM EDST. The board usually runs beyond 9PM daily. Until I can get another server, online times will vary. We honor modems running 9600 baud/MNP 5.

Discussion groups have been setup for all ham radio vendors. Comments shared on this BBS will be conveyed to the ham radio company referenced in the forum. This platform will make companies aware of how the amateur radio community feels about their products. Please indicate otherwise if you don't want the comment forwarded.

I can help people with HF stuff, cheap antennas, and am willing to help
troubleshoot problems with rigs.

I believe that one of the pillars of ham radio - construction/
understanding at the burn-your-hand-with-a-soldering-iron level - is
drifting out of ham radio. With Japanese radios which cost so much,
fewer and fewer hams are willing to risk their warranty to service their
own equipment. I would like to see a turn-around here...

Miscellaneous

++

Put me down for ARES, RACES, and ARRL Field Organization as my
primary areas of interest (I probably qualify at one level
or another for all of the other topics except for perhaps
MARS, CAP, and Skywarn. And if I don't know the answers
I usually know who to ask locally...).

1799. Re: Performance of old gear. (Was: Boycott Icom)

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-03 06:01:50 UTC
From: rovero@oc.nps.navy.mil
Message-ID: <4775@taurus.cs.nps.navy.mil>
Source record: 290326

The sherwood calog has information (newer receivers) more current
than the 1985/6 dates mentioned for some other pubs.....

1800. Amateurs on USENET List May 1992 Part 1/2

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-03 06:28:25 UTC
From: mark@ve6mgs.uucp
Message-ID: <1992May3.062825.18937@ve6mgs.uucp>
Source record: 290327

I would be pleased to take any e-mail updates to this list. I have split this
list into two parts.

Enjoy, 73 de VE6MGS/Mark -sk-

```
# Network address to name or call letters lookup table
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# bowen@cs.buffalo.edu as suggested by Paul Schleck/KD3FU
# archived for ftp @ nro.cs.athabascau.ca:hams/usenet-hams [131.232.1.1] as
# suggested by Lyndon Nerenberg/VE6BBM
# Please send corrections/deletions/additions to mark@ve6mgs.ampr.org,
# mark@ve6mgs.ampr.ab.ca or ...!adec23!mark (depending on how the ball
# bounces :-)
# Last update May 2 1992
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
# the address that many news posters add may be incorrect, personnal
# e-mail contacts or updates are always placed first in the list of
# duplicate calls. Removal of entries is by complaint only, so some
# (mainly .EDU) may be invalid over time. Some GENIE Hams are included
# (Generated by Brian Murrey/KB9BVN) in this list, their addresses are
# listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
# WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
# Name Name of the individual.
# Call Call letters of the individual.
# Date Last update YY-MM[-DD] International format.
#
# A trailing * denotes not searched in call book for verification yet, @
# means not found in my call book (1987). ? after means recheck may be required
# (eg. Call does not match name).
#

```
*=* Kenwood TM-741a GAME Dox *=*
----------------------------

Introduction:

There are actually three GAMES "hidden" on the Kenwood TM-741a Multiband
Transceiver. These are UNDOCUMENTED and I'm not exactly sure who originally
found these games??.. (I came across a brief description of these hidden
games on rec.radio.amateur.misc on UseNet, but no one had the complete
original Post!)

How to access "Game Mode":

1) Turn OFF the TM-741a.
2) Hold the [F] + [MUTE] and turn ON the TM-741a.

(You should see: -1- -2- -3- on your display, you're now
in "Game Mode"!!)

3) Select the Game you wish to play by hitting the appropriate Band
Select Button. ( -1- = Band Sel 1 <far left>; -2- = Band Sel 2 <middle>;
-3- = Band Sel 3 <far right> )

-1- ==> SLOT MACHINE Game

-2- ==> SPACE INVADERS Game

-3- ==> MUSICAL KEYBOARD

NOTE! The [VFO] will always exit you to the Main Game Menu (-1- -2-
-3-).. The [MUTE] will normally Start the Game.

Game #1: SLOT MACHINE:

To play... Hit [MUTE] to start the numbers tumbling. Starting from the
left and proceeding to the right, hit the Band Select Buttons to stop each
number! If you don't get a 3-in-a-row match, the radio plays a sound and
the game is over. ([MUTE] to play again). If you match 3-in-a-row,
then...well I won't spoil it for you!.. (It's neat!!)

Remember; [VFO] to return to the Game Menu.

Game #2: SPACE INVADERS:

The Display... You will see the following display:

000000 ------ 0-0

(Score) (Invaders) (Selected Number - Number of Lives Left)
```

To play... Hit the [LOW] key to begin. The radio will then put a random number from 0 - 9 in the first position in the dashes.. (4-----) you must then use the [TONE] key to select the number the radio selected and then quickly hit the [MUTE] key to "fire" it. The number will then disappear and a new one will appear!.. If you don't act fast, the number will move to the second dash and another random number will appear, (84----).. If you're not keeping up, eventually the numbers will reach then last dash line and you will lose a life!!.. (Once all lives are lost, the game is over!) Also, you must "destroy" 30 numbers before moving onto the next round!.. Each round will start getting faster and faster!!.. So be prepared!! (It really gets TOUGH!!) All throughout the game it will keep score of how many "hits" you made.. (I believe it's 10 points a hit, I think!)..

Remember; Hit [VFO] to return to Game Menu.

Game #3: MUSICAL KEYBOARD:

I don't think this is actually a "Game"??.. What I've been able to figure out is that when you select this "game" the following message appears on the display: Enjoy Sound Play

At this point, the whole keypad on the face-plate of the TM-741a is a "Musical Keyboard"!!.. Try it, hit any of the keys, Band Select Buttons; Cont Sel Buttons; [MUTE]; [TONE]; [MHZ]; Etc...etc..etc... (Except for the [VFO] key, that returns you to the Game Menu!)

=-=

Welp!.. That about all I know!.. Some other things you could try are:

[F] + [REV] (I think!) and Power ON.. (NOTE!!.. This MAY alter some of your memory!! SO write it all down in case you need to re-enter it!)

...this will play some wierd tune on all of your Bands!! It's actually kinda neat...

And one other.. (Which might be documented..??)

[F] + [MHZ] (I think!) and Power ON..

...this will display a light EVERYTHING on the display!!!!!

=-=

If anyone has any other "hidden" features, Mods, etc.. PLEASE send them to me at:
usr1118a@tso.uc.edu

I hope this has been useful to all!.. and I appologise not crediting the person who originally found these Games!.. (Have no idea who it was!)

Have fun, and enjoy!!... Take care!.. and 73! ....KB8NHT (..Jim)

1803. J-ANTENNA : how does it work? how is it mounted?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 02:03:14 UTC
From: johann@nevada.edu
Message-ID: <1992May7.020314.4118@nevada.edu>
Source record: 290230
Cross-posted to: rec.ham-radio,rec.radio.amateur.misc

I just picked up a J-Antenna to do my 2m packet, but I don't see by
its design how it works: it would seem the _metal_ bar across the base
short circuits the input. Except for the short ckt, the antenna reminds
me of a tuning fork...is this a close analogy?

On Mounting: Given the design of the J-Antenna and its metal base, does
it need to be isolated from the mast (which goes deep into the ground)...
Or can it be grounded without affecting the performance of the antenna?

Thanks in Advance,
Jason Cathcart

The ARC I belong to is going to buy a 2-meter rig for a new
club packet station. We are considering the new Alinco DR-1200 T,
which is advertised to have been designed for packet use.
I'd appreciate any and all info about this new radio,
including reviews; experience with it; comments based upon its
advertised features, etc., that might help us decide whether to get it
or not. Email or post OK.
Thanks, and 73,

>watt output', but then with '25 watts AM' in the smallprint at the bottom.
>They are *admitting* that their radio is overdriven and under-heatsinked.
>...

Actually, this may be more of a headroom problem than anything else. A
25 watt AM carrier with 100% modulation is 4*25=100 watts PEP, which is
exactly the same as the SSB rating in your example.

If the rig was rated for more than 25 watts AM, something would be wrong.
Either the AM rating was overly optimistic, or the 100 watt SSB rating is
lower than what the rig is actually capable of. (I'm assuming throughout this
that the rig runs REAL AM, i.e. both sidebands, not just one sideband with
a carrier inserted.)

On the other hand, if the AM rating is less than 25% of the SSB rating,
the duty cycle problem may indeed be a factor.

Regards,
Keith, WA2Q

Source record: 290236

Gary KE4ZV points out the benefits of DSB and/or partially-suppressed-carrier SSB. I wonder if any hams have tried Independent Sideband (ISB)? As its name implies, you transmit two streams of information, one in each sideband of a DSB signal. Its used quite a bit in commercial applications (two RTTY transmissions, or one RTTY and one voice transmission). Biggest problem is that the carrier reinsertion needs to be on exactly the right frequency, and phaselocked. Not a simple task.

Conventional DSB can get away with the CIO not being phaselocked to the signal; indeed a few tens of hertz drift will not upset it too much (you get a 'growl' superimposed on the signal). DSB can be received on a SSB RX this way, though since in most instances the filters in the RX will lop off one sideband, (which contains half the radiated energy) you will get a 3dB loss of S/N when receiving this way compared with making use of both sidebands at the receiver.
Its possible to do a similar trick with full-carrier AM; you put it through a sharp filter to get rid of one sideband and most of the carrier, then detect it as SSB but phaselocking the CIO to whats left of the carrier. This is a great way to clean up AM shortwave broadcasts when you suffer from sideband-splash and heterodyning. By switching sidebands, you can choose the sideband that has the least interference. Dont expect anything more than 'communications quality' though. And music sounds truly awful the moment the CIO drifts off frequency or goes out of phase-lock!..!

>

I went out and got the PRO-2006, after reading Bob Parnass' review of it. Now I am evaluating it, but so far I'm encouraged by its apparent lack of intermod (I am right below several extrememly powerful paging transmitters) and fast scan speed. It isn't the radio that the R7000 is, but is better at scanning.

To all radio amateurs

SB QST ARL ARLB040
ARLB040 ARRL hosts course

Government officials from five nations are this week attending the annual U.S. Telecommunications Training Institute course in Amateur Radio administration at ARRL Headquarters in Newington, Connecticut.

Those attending include Michael J.B. Olivier, Director of Communications, Botswana Red Cross Society, Botswana; John K. Tandoh, Chief Communications Officer, Communications Research and Development, Ghana; Carlos R. Funes P., District Chief, HONDUTEL, Honduras; A. Cristian Antoche, Chief, Bucharest Department, General Inspectorate of Radiocommunications, Romania; and Adam O. Kimbisa, Secretary General, Tanzania Red Cross Society, Tanzania.

The course is conducted by International Amateur Radio Union President Richard Baldwin, W1RU, assisted by IARU Secretary Larry Price, W4RA, and ARRL Headquarters staff members.

The objectives of the course are to acquaint telecommunications officials with many aspects of Amateur Radio, especially its value to society, and how it is regulated by countries around the world.

>I measured the attenuation, insertion loss, and insertion SWR of
>mine, and all were excellent.
>
>Scott Ellington K9MA
>sde@larry.sal.wisc.edu

I also have the I.C.E. low pass filter and agree with everything Scott said.
When compaired on a spectrum analyzer with a better known brand, that costs
$10 more, the I.C.E. more than held its own. The filter seems to have no
problem handling what my Alpha 76PA (3-8874s) can put out.

1819. Data on RCA or ITT tube wanted.

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 14:42:52 UTC
From: davek@mph.sm.ucl.ac.UK
Message-ID: <16223.9205070836@mph.sm.ucl.ac.uk>
Source record: 290246

I've recently purchased a number of valves that are made either by RCA or ITT. The RCA ones are marked:

RCA
JAN
DOD006
26720
80-20

The ITT ones are marked

ITT
DOD-006
7724
20948

The supplier told me the RCA ones are the RCA 7213 and the others similar, but I would like it confirmed if this is true.

The Valves are of a coaxial construction and look designed for UHF. I have data on the RCA 7213 which is briefly

3kV @ 1A HT
700V screen
1500W anode dissipation
1100W output at 600MHz
Frequency of maximum ratings 1215MHz.

Looking at the tubes (size, coaxial construction etc) I can well believe they are okay at 1215MHZ and can dissipate 1500W, but I would like it confirmed before I try to design a 2m, 70cm and possibly 23cm amplifier using them.

Does anyone know of the DOD-006 (which is marked on both the RCA and ITT tubes)?

Dave Kirkby G8WRB

1820. ham RFI to Lojack ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 14:58:23 UTC
From: jmccombi@BBN.COM
Message-ID: <l0ihcfINNnf9@news.bbn.com>
Source record: 290247

[For those who don't know: Lojack(r) is a small transmitter hidden somewhere in your car. When the car is stolen, you call the police, they "activate" your Lojack, then use a doppler DF system to find your car. Lojack appears to have a near monopoly in my area; you may know this system by a different brand name.]

I'm considering having Lojack installed in my car. Should I be worried about RFI to the Lojack from my rig? How about to my rig from the Lojack? I assume the Lojack only transmits when I have reported the car stolen, but what about its receive circuitry? Is it noisy? What frequencies does the Lojack operate on? Anything near, say, 146, 222 or 440 MHz? It would be pretty embarrasing to have the Lojack think it was "activated" by my keying up the mobile rig in my car...

If you have direct experience with Lojack-type systems in a ham-radio-equipped car or can shed light on my questions, please e-mail to jmccombie@bbn.com or {harvard, others}!bbn!jmccombie. I will gladly summarize to individuals or to the net if interest warrants.

Thanks in advance and 73 de
Jon N1ILZ

1821. TALKING RECEIVERS.

From: graham%drcv06.DEcnet@drcvax.af.mil
Message-ID: <9205071457.AA12126@ucsd.edu>
Source record: 290248

IN THE PAST TWO YEARS, MY EYESIGHT HAS GONE SOUTH, AND ISN'T PROBABLY COMING BACK. I HAVE ACCOMODATED IN MY JOB AND HOME LIFE, BUT NOT MY HAM LIFE. I KNOW I CAN GET LOW BAND GEAR THAT TALKS FREQUENCIES TO ME, LIKE THE KENWOOD 440 OR 450. I AM A RECEIVER BUFF, THOUGH, AND WANT A VERY GOOD GENERAL COVERAGE RECEIVER AND A VHF/UHF SCANNER WHICH ALSO "TALK" THE FREQUENCIES. ARE THERE ANY RECOMMENDATIONS FOR SUCH RECEIVERS? I WOULD LOVE SOMETHING LIKE A BEARCAT SCANNER, BUT WITHOUT VOICE SYNTHESIS, IT'S USELESS. I KNOW THAT THE KENWOOD 450 WOULD GIVE ME GENERAL COVERAGE RECEIVE WITH THE VOICE, BUT I WANT A BETTER RECEIVER THAN THAT. ALL SUGGESTIONS ARE WELCOME.

(IF THIS TOPIC HAS BEEN RECENTLY DISCUSSED, I'M NEW, THEN EMAIL ME DIRECTLY.)

1822. License question...

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 15:13:01 UTC
From: mark@lenti.med.umn.edu
Message-ID: <1992May7.151301.10251@news2.cis.umn.edu>
Source record: 290249

Hello, I'm wondering where I can find out information about ham licensing -
I got a Novice ticket in ~1977-78, lost interest and did not get the license
renewed. Now I have gotten the "bug" again and am interested in getting a Techician
ticket. My question is : Do I have to retake the 5wpm Morse test or can I
just take the theory test? If I have to re-learn Morse I probably will drop
the whole thing; I don't have the time or patience to learn it again and
certainly am not interested in communicating CW.

My call letters were WD0EJT, I'd be curious to see if they are still assigned to
me (It HAS been a long time, they have probably been reassigned), if so,
can I just upgrade?

Thanks!

mark olson

I received a personal email request for advice that I thought I would share with the net. After this I promise I will shut up about EMI/RFI for a while. :-), Ed.

To: uhasun!nvuxr.cc.bellcore.com!karayan
Subject: Re: TVI blues
Message-ID: <648@arrlhq.UUCP>

>I saw your latest posting in netnews on TVI and what the ground
>contributes to it. Finally! Somebody understands me! People keep
>telling me that I need to find good ground, etc. However, I live
>in a 2nd story apartment. The grounding path will go from my livingroom
>(where the rig is) to the kitchen (cold water pipe) and down, through
>the 1st floor and basement, to the ground. If this path doesn't
>radiate like crazy, I don't know what will.

It sure will!

>Soooo, I am running my rig into a balun, flat-ribbon feedline and
>to a 15m folded dipole. Everything is balanced after the tuner.
>Otherwise, my ground is floating -- nothing connected to the lug.
>Do you see any problems with this arrangement?

Not from an EMI standpoint. There are safety considerations that I will not get into here.

>Nevertheless, I have TVI problems galore! I haven't been all that
>successful getting out with the indoor antenna, but my two TVs get
>me just fine! I assume that the house electrical wiring picks up
>RF from the antenna and feeds it to the TVs. Am I right? Would
>power-line chokes correct the problem?

I think I would try the "standard" TVI remedies. Contact your section Technical coordiator (located through your Section Manager - page 8 of QST - or ARRL HQ.)

* Install a low-pass filter between the transmitter and the antenna tuner. If the TVI is on channels harmonically related to 15 meters, ie channel 3 and channel 6, this will probably be the cure. Even if not, put it on anyway. The TVI might stem from both station harmonics and fundamental overload. This way you will be confident that it is not your station.

* Purchase some FT140-43 ferrite cores. (#43 is the material of choice for 15 meters. If you also operate on 80, get some FT-140-J, FT-140-75, or FT-140-77. If you have RG-8 (or equiv size) cable, or a BIG line cord or plug, you may need to use an FT-240 size core.)

* Wrap about 10 turns of the transmitter's AC line cord around one of these cores, as close as possible to the transmitter. This is a common-mode choke. (If you have other AC-powered equipment connected to the transmitter, ie keyer, SWR meter, TNC, etc, install one of these on its AC line cord, too. The idea here is to prevent any chassis RF (harmonics or fundamental) from seeking earth via the power lines.)

* Do the same thing with the coax cable between the tranmitter and the tuner. This is also a common-mode choke.

* Now you know that the transmitter is (probably) clean.

* Simplify the TV installation. Multiple TVs, VCRs, etc make it impossible to troubleshoot. Get it down to one antenna or cable and a TV. If it is cable and a non-cable-ready TV, use the set-top converter or VCR as you normally do. After you get the bugs out, you can start adding stuff back one at a time.

* If you have a TV preamp, booster or distribution amp, get it the heck out of there. These things are notorious for overload.

* Install a high-pass filter on the TV (or before the set-top converter/VCR.) If using a set-top converter/VCR, you may need to use one before the converter AND before the TC.)

* Install a common-mode choke in the same location(s). If the TV is using a CATV or community antenna, I would try the common-mode chokes before the high-pass filter, just to play the percentages.

* Install a common-mode choke on the TV and set-top converter/VCR AC-line cords.

* If you still have interference, try using a differential-mode AC-line filter on the TV, set-top converter or VCR, and the station transmitter. Radio Shack catalog 15-1111 is universally available.

* If you still have TVI, either you have one of those "wierd" problems that you don't even want to think about, or you have a TV that is just so susceptible that it can't be helped. If so, call me here at HQ. I will offer some advice. But please, read the RFI Tips handout and the Radio Frequency Interference book before you call me. I don't mind helping, but would prefer that we not have to cover the basics.

>Needless to say, I have not advertised that I am a ham and I operate
>in the deep dark of the night. No wonder I'm getting nowhere; that's
>when 21m is dead. Any advice?

Yeah, move! Actually, the best solution is to clean up your own house. That may take care of everyone's problem. If not, at least you can demonstrate that it is not your equipment. Do be careful, though. If you mishandle the situation you may find yourself having to buy a few hundred ferrites, high-pass filters, etc. You are not bound by law to purchase any filters to compensate for inadequate filtering in consumer equipment. Some hams take the easy way out and pay for the one filter needed to help one neighbor. You probably can't afford that luxury.

>I would appreciate any pointers, Ed. Thanks in advance.

1825. Re: DSP is _____?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 15:49:46 UTC
From: gingell@aurw6b.UUCP
Message-ID: <9205071327.AA13757@aurw6b.aur.alcatel.com>
Source record: 290252

rob simmons5275@network.UCSD.EDU asks
> Excuse me if this is a dumb question, but I am new to this hobby.
> Anyway, what the $^%#$%# is DSP? It is so anoying to hear
> others talking about something that youdont have the slightest clue
> what it is!

DSP is Digital Signal Processing, that means using digital techniques
to do what you would otherwise do with analog circuits - filters,
modulation etc. The advantages are that it can be done much more
accurately, that one can use all the cost advantages of modern digital
technology (integrated circuits) and a single box can be programmed
to do many different functions, including some that have not been thought
of yet - just by changing the program in ROM or RAM.

For a simple example imagine a filter made of coils and capacitors, it
provides its frequency response by phase shifting the signal by varying
amounts at different frequencies and then recombining them such that at
some frequencies the signals add and at others they cancel. Now in the
digital equivalent we do exactly the same thing except with NUMBERS. We
sample the input signal at regular intervals using an analog to digital
converter which produces a stream of numbers. If you were to plot these
numbers out on a piece of graph paper and draw a smooth line through
them you would see the original waveform. Now if we take this stream of
numbers and delay it and add it multiplied by a scale factor we are
taking to copies of the signal and recombining them to produce a
new stream of output numbers. We now pass this to a Digital to Analog
converter which generates a voltage proportional to each number and
we smooth the result with a simple analog filter. The result - a
digital filter. For a modulator - multiply the stream of numbers
by another stream representing points on a sine wave.

Easy isn't it?

hugh_davies.wgc1@rx.xerox.COM writes...
>The music over the closing credits of the British TV detective show "Inspector
>Morse", which otherwise has nothing to do with amateur radio, features the word
>"morse" sent repeatedly in CW. A CW pun?

In fact, in a recent documentary programme (shown on British
television) about "the making" of the Inspector Morse series, it was
revealed that the person responsible for all the (original) music in
the series plays a greater "pun" on Morse's name and the morse code
than has so far been commented upon in this "thread": Not only is the
title music's rhythm arranged to spell "M O R S E", but every episode
has its own unique incidental piece which spells out the name of
the guilty party for that particular episode! It is (apparently)
always played within the first 15 minutes of the programme, but is
designed to be obscure, so that even the best CW operator can't easily
discover it hidden within the music without knowing what they're
suppose to be listening out for.

It's nice to think that radio hams might be being given a subliminal
advantage in forecasting the outcome of each programme, though!

> Does anyone make a shaft encoder
> whose output is an analog voltage?
>

That function is performed by a conventional potentiometer.
For antenna work, use a 5 turn potentiometer to get
360 degree coverage. Or use a 2 to 1 gear set with a
270 degree pot.

You can buy digital potentiometers from Hewlett Packard's
Opto Division. You would need to connect their digital
output to a counter and a DAC to get back to an analog voltage,
but why go to all this trouble when a potentiometer already
has an analog output.

Interesting idea, but the noise I'm getting definitely varies with the speed
of the engine -- not a likely occurrence if the noise were caused by
the fan. I have noticed that the rear wiper motor causes interference as
well, but since I don't run the rear wiper much, it doesn't bother me. This
ignition noise, however... :-(

One idea would be to take a non-talking receiver with a computer control capability & write a talking control program for the computer.

Probably fairly easy for the Icom R7000 and the like. Icom even supplies a GW-BASIC control program for the thing if you ask them. Adding a speech synthesis routine would be real easy...I think there are some shareware ones available that'll do the numbers.

1833. Help: Mobile Ant as compact HF dipole

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 18:57:36 UTC
From: hatzakis@fovea.stanford.edu
Message-ID: <HATZAKIS.92May7185736@fovea.stanford.edu>
Source record: 290184

All:

I was wondering if I could get some feedback on a crazy idea
I just thought of. Could I use a mobile trapped verticle as a
compact outdoor HF dipole ? -----|||-----------| |-----------|||-----
where the ||| are the traps and antenna
would be fed in the center with a 50ohm feed. I would, of course,
have to have two HF mobile antennas. I also assume
that there would be worse performance than a "real" dipole.

My problem is that if I can't stick it out my apartment window,
I can't operate HF. I just moved in and am not ready to approach the
landlord regarding putting upo dipoles on the roof.

So I was thinking of sticking this thing out my window with a bracket
whenever I wanted to operate HF and could change bands by changing the
traps.... Would the tuning of the length be the same as in the
mobile, car, configuration ? Might I get out with reasonable
signals ??

Thanks for your comments, Mike WB2TBQ or HATZAKIS@CAMIS.STANFORD.EDU

[deletions regarding underated components...]

It's not that the components are underated but that these are low-level modulated radios. They are modulating a grid, base, or gate and are only around 33% efficient. With 100 Watts DC input, they only get about 33 watts output. On the other hand, high-level modulated gear like my DX-100, where the plate is modulated are most efficient with usually somewhere near 60% or greater.

I believe this is why you can only get 25 Watts of carrier out on AM from the newer trade deficit radios. :-) and the older grid modulated rigs like my DX-60 and Knightkit T-150.

Having fun reading the discussions!! Nice to hear that some of the hams on the net are having a blast with the radios from the past. I know I do See you in the AM windows on 75m and 40m with AMERICAN MADE radios...

Old true AM rigs such as the DX 100, Apache, and Globe King 500 had true AM modulation where the final amplifier ran class C and was modulated directly. I took almost as much audio power to do this as RF power. These rigs sounded great on AM. This was Plate Modulation. You modulated the power supply serving the final amp. It took less power to do screen grid modulation but these were inferior to the big guys.

Later SSB rigs started producing the SSB signal at a low level and mixing/hetrodyning it to get it to the final frequency, amplify it class A or AB1 at the final. An AM signal had to be amplified at class A. The same hardware couldn't produce as much power this way. That's why modern SSB transmitters that also can run AM produce such wimpy signals.

Heathkit's Maurauder could never produce the AM signal that it's predecessor Apache could. The Maurauder was Heath's first serious SSB transmitter.

1841. Re: Performance of Old Gear

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 20:21:22 UTC
From: sde@larry.sal.wisc.edu
Message-ID: <1992May7.202122.5560@sal.wisc.edu>
Source record: 290266

One reason the AM power capability of many solid state transmitters is limited is that the peak power of AM is 4 times that of the carrier. No matter how large the heat sink is, the peak power is limited. Also, distortion products increase very rapidly as the output stage is driven towards saturation. Typical high quality transmitter output stages are designed to operate at a peak power of less than half the saturated output, just to minimize distortion products. So, a transmitter capable of 100 W PEP on SSB and 100 W AM would have to be designed for a saturated output of 800 W or so. That just wouldn't be economical. (However, with the appropriate thermal design, such a transmitter could be operated at 400 W PEP on SSB, as well.)

In summary, if you want a 100 W solid state AM transmitter, you should be prepared to pay for one capable of 400 W PEP.

> of the dangerous 60 Hz radiation would decrease by the square of the distance,

Yes, they've been trying to coorellate and exposure/risk curve and the
fanatics have been claiming strange phenomena that weaker fields are
more dangerous than stronger ones. Of course, the other possibility
(one that I think probably applies to this and other scare things
like asbestos) is that the reason they can't come up with a decent
coorelation is because there is none.

```
*> Yaesu accessories are generally useful and fairly priced. Speaker mics
*> and headsets from Icom radios also work on the FT470.
*
*Warning: while my Yaesu microphones always work the icom, and many of
*the Icom mikes work the Yaesu, I've got one Icom speaker mike that the
*will key the Icomm (32AT) fine, but won't make the FT470 transmit.
----------

Both Icoms and Yaesus go into transmit by switching a resistor across
the mic input. The Yaesus require a lower resistance to go into transmit.
Put an ohm meter on the mic connector of the speaker mic and push the
PTT button to see what it has. Icoms can apparently work with 15 Kohms,
Yaesus need around 2 Kohms or less. My Yaesu would go into transmit
with 5 Kohms when I was on a 7.2 volt battery, but I had to drop to
2 Kohms when running off the battery of my motorcycle. If you butched
a smaller resistor into the problem speakermic it would work fine.

1845. ICOM IC-245/SSB Manual

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 20:32:19 UTC
From: ws1f@norman.VI.RI.CMU.EDU
Message-ID: <1992May07.203219.25052@cs.cmu.edu>
Source record: 290270

I'm trying to get a hold of a service and/or user manual for an ICOM IC-245/SSB (this is the model with the "detachable" SSB module that mounts under the radio). If anyone has access to either manual, I would be most grateful if it could be loaned for a few days. It seems that the tuner drifts significantly on mine, and the transmitter needs repair. I would pay for postage both ways, as well as any other inconvenience.

If anyone has had luck solving the frequency drift problem as the rig warms up, I would appreciate your insights.

Thanks in advance for the assistance.

You would have been given credit for the 5 WPM if your license was current or within it's grace period (which if you got it in 1978, then that has gone by), however good news:

The Technician Class license no longer requires morse code.

As for your callsign, it's not assigned to you, but not to anyone else either. The FCC doesn't reissue call signs (I don't think their computers are up to it). They do stop listening you after you don't renew for a while (this is the only way they find out when people die I think).

1847. Antennas and lightening

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 20:57:46 UTC
From: garfield@sunspot.noao.edu
Message-ID: <1992May7.205746.6485@sunspot.noao.edu>
Source record: 290272

I replied to Ed on the antennas discussion. He suggested I share my remarks.

You see, I ALWAYS disconnect my antenna from my radio when not using it. I HAVE to... I live on top of a mountain at 9200 feet, and the lightening gets so thick that my kids and I just sit back and watch the show during the summer.

A couple of years ago, a house down the street had the bedroom wall launched in several different directions. The phone company has had fits up here, and I've even seen grounded equipment get craters in its IC's.

So yes, there are those of us that ALWAYS disconnect the antenna, not to mention the power. (Ever hear your house wiring spark in the middle of the night?!) Otherwise, all my silicon would be toast.

>a transmitter to use for SSB only, I wouldn't *want* one with enough
>heat sink and power supply for 100% duty cycle because I wouldn't want
>to pay for a capability I didn't plan to use.
>-------

OK I agree... its just like the designers of audio gear; they usually quote
'Peak music power' in their specs. Typically these figures are several times
the RMS rating. Only the audiologically-impaired run audio amplifiers
at their peak-music-power output for any length of time.

The problem comes when you get a '100 watt PEP' radio, then hang a speech
processor on the front-end and a typical ham wattmeter on the back-end;
your average ham expects the needle to read 100 watts, so he goes on turning
up the MIC GAIN, oblivious to either the splatter he is generating, or the
heat buildup in his finals..... ALC saves some people from final-meltdown.

I have repaired several ham transceivers in which the components used for
the antenna matching network are hopelessly underrated (who uses 50-volt
rated capacitors in a circuit that, according to the calculations, will
have peak voltages of 70 volts RF, and a static 13.8v DC superimposed?
Yaesu do!). Also, the designers seem oblivious to the idea that
you choose components not only for their capacitance or inductance, but
also for their ability to handle circulating RF current without getting
hot....
Properly-rated equipment should be reliable.... i always wonder what
people are doing to their transmitters that require tube-changes after only
a few years of intermittent operation; i have four 6146's in push-pull-
parallel that have each done over 30,000 hours continuous duty, and they
still show 100% emission on the tube-tester.

1849. Receiver performance (was performance of old gear)

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 23:21:19 UTC
From: 5rtrtrt@cbnewsf.cb.att.com
Message-ID: <1992May7.232119.9638@cbfsb.cb.att.com>
Source record: 290274

All of the postings lately on receiver testing have been great, and I especially appreciate the comments from the ARRL technical staff. Thank you.

I am still puzzled as to why we persist in putting so much emphasis on "dynamic range" as opposed to the much more accurate measurement of third order intercept point. Dynamic range CANNOT (by itself) be used to compare receivers because it is a figure that is relative to the noise floor of the receiver (which may be different for each receiver). Dynamic range is a measurement of the strong signal handling performance of the receiver. It can be measured in a number of ways, but the objective is to get the receiver to develop intermod that can be measured. Intermod in any given receiver is a function of the level of the interfering signal level, and as the interfering signals increase in level the intermod increases 3 times as much (in Db).

The ARRL measures intermod by injecting two strong signals of equal level into the receiver, and increasing their levels until intermod is detected AT THE NOISE FLOOR OF THE RECEIVER, IN A LABORATORY SETTING (A SCREEN ROOM !!!) The "spurious free dynamic range" is then the level of the interferers minus the level of the intermod (which is equal to the noise floor). A bigger number equates to a better receiver, right?

********** WRONG **********

By using dynamic range to compare two receivers you MAY end up with the wrong conclusion about the actual strong signal performance of the receiver.

To clarify: Say we have two receivers. One has a noise floor of -130 dBm, the other has a noise floor of -140 Dbm. (-140 Dbm is a more sensitive receiver than -130 dBm). Put both receivers in the ARRL screen room, connect up the HP 8640B signal generator with its excellent shielding, and sure enough the -140 dBm receiver can pick up a weaker signal. Now, connect an antenna to either receiver and inject your -140 dBm signal into the antenna port simultaneously and neither receiver will be able to copy it. The atmospheric noise will be louder than -140 dBm. Next, to do the intermod test, the tester will inject big signals into the front end and increase their level until intermod is detected in the receiver. He notes the level of the interferers and the difference is the magic number that gets published. Lets say both receivers have a dynamic range of 100 dB. In the case of the -140 dBm receiver the interferer level is at -40 dBm when IM occurs. In the case of the less sensitive receiver (noise floor of -130 dBm) the interferer level is -30 dBm. Which is the strongest receiver? The specs on the -140 dBm receiver impress you, and they both have the same dynamic range!!

Actually, ARRL began publishing 3rd order intercept a few years ago, along with dynamic range, and it is the figure that should be used to compare receivers because it is an absolute figure, not one that is relative to the noise floor. Look at 3rd order intercept, and look at sensitivity if you need to and you have a good picture of the receiver and the way it will perform in both a strong and weak signal environment. Look at dynamic range and you will get confused!

Another byproduct of using and understanding 3rd order intercept is that it does not cause receiver tests to be "noise limited". There is a REAL weakness in the ARRL technique. If the interfering signal levels are being increased, while the tester is waiting for the appearance of IM at the noise floor but noise appears first (due to phase noise in the LO) the ARRL abandons the test and says the receiver is "noise limited". This is because the noise has masked the ability to detect the weak IM at the noise floor. However, the 3rd order intercept can be measured at any level, in theory, at least. The tester could merely increase the levels until the IM appears and note the level (read the S meter) and do the calculations to determine the intercept point. The IM rises at a 3 times rate, while the phase noise rises at a 1 times rate, so the IM will quickly "outrun" the phase noise. A quick way to do the calculation is to take the difference, cut it in half and add it to the interferer level. I have done this many times with my homebrew setup.

Ok, there is plenty of food for thought. Comments please? Then I have opinions on the subject of spacing which I will try to post next week. But be thinking about it. Hint: Give me a spacing and I will give you an intercept point. Makes all the measurements in QST nearly useless! Stay tuned to this frequency.

1850. Source of 460MHz Radios?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-07 23:27:31 UTC
From: seanp@undr.org
Message-ID: <1992May7.232749.7CRR4@undr.org>
Source record: 290275

I am presently in need of a 460/467MHz business band radio, and am looking for suggestions for sources of such a radio. I need a radio that is SYNTHESIZED (either prom programmed or by computer), it must be at least 25 watts output, and it must have at least 16 channels.

If anyone can recommend a commercial radio (Manufacturer & Model), as well as a dealer or supplier, I would be very grateful.

I have posted several messages searching for a used unit that fits these specs, but to no avail...

Sean

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

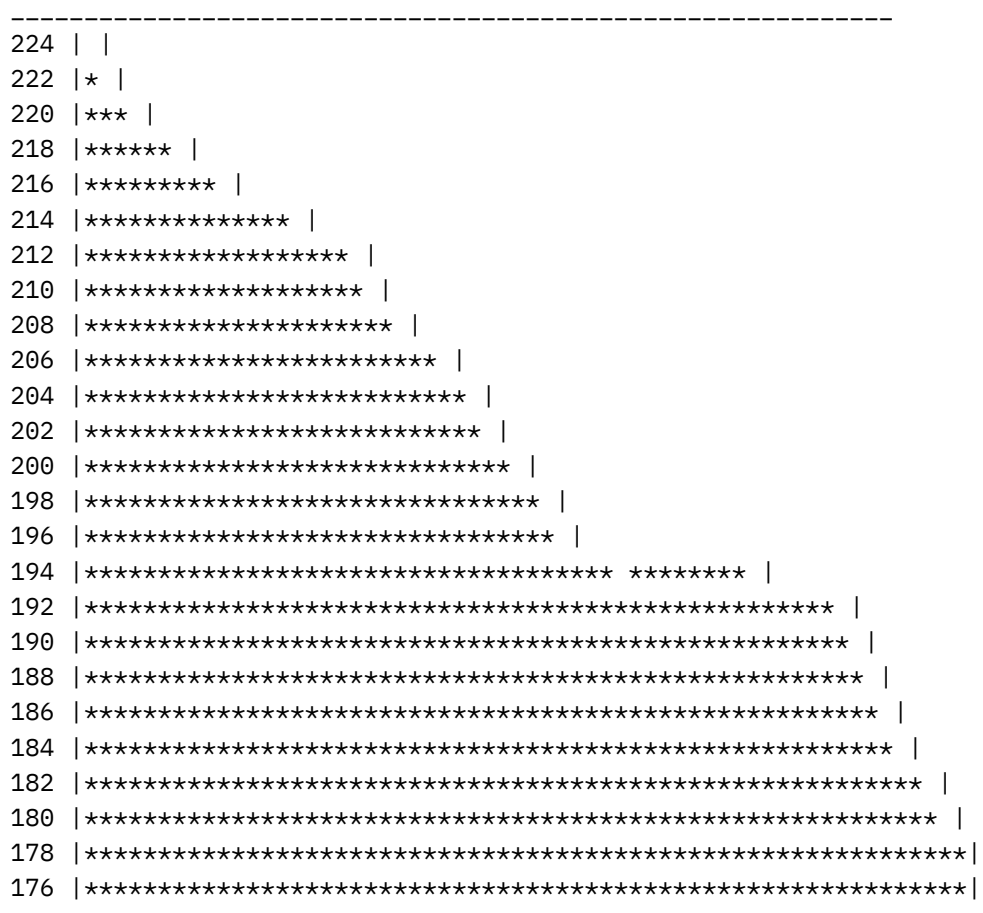

Chart Start: Day #068

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

Comments:

SWL-Carlton Wolfe: "I am an SWL unfamiliar with the ham-bands. I am only 13 years old. I learned more of the ham areas, and had plenty of fun."

SWL-Kevin Klein: "I was able to listen only one day. I greatly enjoyed the time spent. Thanks and 73."

K6IR/3: "It sure was a great event and a wonderful opportunity to chat with so many VOA [hams]. I have a spot on my shack wall picked out for [the VOA 50th anniversary certificate's] display."

W6OV/VOA: "Worked at VOA/Delano for 10-1/2 years."

KA0ZSB: "Congratulations on 50 years [of] broadcasting to the world."

K7ZTM: "The band was bad at our location. Maybe we will do better next time. 73."

VE6IC: "I was only able to work ONE VOA amateur station."

W3FZT: "I hope to receive one of those special VOA 50th Anniversary QSL cards. Thank you. 73."

W6YO/VOA: "I hope [all] the participants enjoyed the event. I did. [I] only wish I could have heard more, however we tried."

Jean LaFaurie - SWL/FE1RVL/F6ACC: "It has been one of the most difficult contests I met. I thank you for your indulgence on my poor participation." [Jean - No apology is necessary. We appreciate your help in the VOA's 50th anniversary celebration. 73 and good listening! - Contest Committee]

V31VOA: "I had a great time...made 7,082 contacts in 104 DXCC countries as well as all 50 US states. [I also had] 2,000 QSO's on CW. There were 67 ["VOA" contacts] with a total of 119 points received. I am looking forward to another QSO Party in 25 years!" [Congratulations, Scotty! It looks like you collected more than twice the points of any other station, and made far and away more contacts. V31VOA was truly "radioactive." Thanks for your help. - Contest Committee]

AA4WB/VOA: "What pileups! Received many kind comments re:VOA. Lots of congrats re:VOA 50th Anniversary. Many happy listeners in Europe and the former Soviet Republics. Russians and Ukrainians were especially excited. I'll print some special [VOA] QSL cards."

N2FTR: "Where was everyone??"

WA3FYZ/VOA: "I worked from my home station and the flagship VOA station, K3EKA. It was great to meet so many VOA hams on the air. Everyone all over the world seems to love "the Voice." In the hundreds of contacts I made, there was not one single negative remark about VOA! I even had one station in Russia whistle "Yankee Doodle" to prove he was a regular VOA listener!"

Bill McClintock - SWL: "Enjoyed the contest! A bit disappointed I didn't hear more after the first couple of days. Belated Happy Anniversary to VOA."

KK8I: "[I] Retired from Bethany in 1980."

I3BIP: "Many Congratulations [on VOA's 50th anniversary and to the VOA Amateur Radio Club] for [sponsoring this] event."

WDX3JFH - John F. Holterman - SWL: "It is too bad more SWLs didn't participate. I had a great time and my wife had a fit!! Congratulations to all at VOA on the 50th Anniversary and the QSO Party."

OE3-3008372 - Hans Pammer - SWL: "I get (sic) very lucky to work this special event 50th Anniversary QSO Party. The day I heard [about] the VOA QSO Party was a special day for me."

>how can I reduce or eliminate the problem at the PC?
>Thanx in advance. Reply here or to my e-mail address.
>Suseea@maine.maine.edu

For the most part, the EMI generated by a computer falls into two categories:
that which can be fixed and that which cannot.

A practical solution is to start with fully shielded cables.
THen put ferrite common-mode chokes on all leads
to and from the computer and peripherals. Because the noise could also
be coming from the peripheral devices, including the keyboard and
monitor, it might be necessary to apply a common-mode choke on each end.

You might want to do some troubleshooting first. I would disconnect
and unplug all unneeded peripheral devices. You may be able to determine
that the problem is coming from a monitor, keyboard or printer, for example.

If the external cures do not effect a cure, it may be necessary to
go inside. That can be a real nightmare. Re-engineering a high-speed
digital circuit after the fact can be nearly impossible. Rise and fall
times in some circuits are critical, so you can't just hang decoupling
caps everywhere. Even adding shielding can change the heat flow and
distribution, thus affecting cooling. If the case is plastic, the
proper application of spray-on shielding (GC-Thorsen, 1801 Morgan St,
POB 1209, Rockford, IL 61102-1209,815-968-9661, catalog # 10-4807), or
EMI Tape, 3M, 6801 Riverplace Blvd, Austin, TX 78726, 800-233-3636 might
help, but even this has its risks. For example, if the case is not properly
primed the paint could flake off, sending conductive bits of paint metal
where it will certainly do the most possible harm. I suggest that you
learn as much as possible before tackling this type of task.

The ARRL book - Radio Frequency Interference, How to FInd it and Fix It -
has a chapter on computer EMI. This may be a good place
to start. I am still looking for feedback on the book,
especially this chapter. Computer EMI has not been extensively treated
in amateur literature in the past and I am always looking for more information
and other points of view.

I just switched to OS/2 V2.0 and everything's working well *except*
that Super Morse 3.15 dies immediately whenever I try to run it in a
dos box. This is the first dos program that I can't run under os/2.
Does anyone know whether the author will be coming out with an os/2
compatible version of the program?

1857. TS-120S problems

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 01:09:15 UTC
From: holt@sdd.hp.com
Message-ID: <1992May08.010915.9380@sdd.hp.com>
Source record: 290182
Cross-posted to: sci.electronics,rec.radio.amateur.misc

I recently purchased a used TS-120S. While 80 and 40 meters seem to work OK, the rig has some problems on 10-20. On these bands, the rig is oscillating as soon as the mike is keyed. It appears that the frequency of the oscillation matches the band the rig is on; i.e., when on 10 meters, the output frequency is about 28 MHz (I have only looked with a scope). The ALC meter is being violently pegged under these conditions, and the current going into the finals is in the 17 amp range.

Does anyone have any suggestions? Most of my experience is with good ol' tube rigs. I would like some pointers as to what might be going on. Thanks.

1858. Voice of America Amateur Radio Club Gets New Call Sign - K3VOA

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 01:41:22 UTC

Source record: 290183

___VOA Amateur Radio Club Gets New Call Sign - K3VOA

In an unprecedented move, the Federal Communications Commission has issued a license modification to the Voice of America Amateur Radio Club to change its amateur radio call sign from K3EKA to the more recognizable call sign K3VOA.

For more than ten years the club has made several informal inquiries in an effort to secure a "VOA-suffix" call sign. In every case the FCC cited that the request was directly prohibited by the Rules and Regulations Part 97.17.

During VOA's 50th anniversary in February, the new USIA Director of the Bureau of Broadcasting (which includes VOA), Chase Untermeyer, expressed a desire to visit the VOA ARC ham shack. Club president, Al Brown (WA3FYZ), felt that this would be a perfect opportunity to ask Mr. Untermeyer to intervene in the club's behalf and ask the FCC Chairman to grant an exception. Mr. Untermeyer agreed and asked Al Brown to draft a letter for him to sign, which was sent to Alfred Sikes, Chairman of the FCC, in March.

In his reply, Mr. Sikes stated that considering the importance of the 50th anniversary of the Voice of America and that other governments around the world have issued VOA-suffix call signs, "I have asked ... that Rule 97.17(f) be waived and that the VOA headquarters amateur radio station be issued a "VOA-suffix" call sign."

To our knowledge, this is the first time since the adoption of FCC Rule 97.17(f) that a waiver has been granted.

The license for the new call sign K3VOA was mailed from the FCC office in Gettysburg, PA on May 7th.

Yes! Good to hear from some of the other firebottle fans.
I have confined my Ranger/Viking I/Viking mobile/HWells T90/Apache
activity to 10 and ocassionally 15 and 20. Where on 40
does everyone meet? I have heard some activity on
7290... is that the place?

In regards to the comparison testing, how about a Collins
75A4 versus one of the current tran/receivers?

1860. Qualcomm CDMA specs available for FTP

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 02:32:14 UTC
From: karn@qualcom.qualcomm.com
Message-ID: <1992May8.023214.24565@qualcomm.com>
Source record: 290187

I am happy to announce that Qualcomm has released most of the text of the CAI (Common Air Interface) for its CDMA (Code Division Multiple Access) digital cellular technology, as recently submitted to the TIA TR45.5 standards committee evaluating wideband spread spectrum digital cellular telephone technologies.

It can be retrieved by anonymous FTP from lorien.qualcomm.com (192.35.156.5) in the directory /pub/cdma.

Due to copyright considerations, chapters 2-5 of the CAI are not yet available for FTP. They deal only with the analog FM mode used for backward compatibility with existing cellular systems and as such contain material previously copyrighted by TIA. If or when we receive permission to release these chapters, we will.

The /pub/cdma directory contains the following files:

announce - this file (ascii text)
copyright - copyright notice (ascii text - please read)

FrontMatter.ps.Z - Table of Contents, compressed Postscript
Chapt1.ps.Z - Chapter 1, " "
Chapt2-5-notice
Chapt6.ps.Z
Chapt7.ps.Z
AppendA.ps.Z - Appendices
AppendB.ps.Z
AppendC.ps.Z
AppendD.ps.Z
AppendE.ps.Z
AppendF.ps.Z

The RSA MD-5 message digests for these files, as computed on a Sun Sparcstation, are as follows:

18cd3fa05520dbd289936bf8d64b0743 copyright

56d3da1d12b69756a3505ee416c8d0d3 FrontMatter.ps.Z

Whoa! Had to do a serious double-take there!

"Unprecedented" is right! To see the stubborn-as-granite FCC actually
relent and do this is like seeing water flow uphill! :-)

>For more than ten years the club has made several informal
>inquiries in an effort to secure a "VOA-suffix" call sign. In
>every case the FCC cited that the request was directly prohibited
>by the Rules and Regulations Part 97.17.

That includes individuals who have let callsigns lapse, and club
stations that let licenses expire (and no amount of hard-luck stories
and intervention of Congressmen will make the FCC change their minds).

>During VOA's 50th anniversary in February, the new USIA Director
>of the Bureau of Broadcasting (which includes VOA), Chase
>Untermeyer, expressed a desire to visit the VOA ARC ham shack.
>Club president, Al Brown (WA3FYZ), felt that this would be a

>in March.

>In his reply, Mr. Sikes stated that considering the importance of
>the 50th anniversary of the Voice of America and that other
>governments around the world have issued VOA-suffix call signs,
>"I have asked ... that Rule 97.17(f) be waived and that the VOA
>headquarters amateur radio station be issued a "VOA-suffix" call
>sign."

So now we know, the FCC *ISN'T* absolutely tied to their damn computer-
program-from-hell that won't let them issue licenses out of order, and
club licenses maintained manually on index cards (in the hope that they
will "go away").

I'm both very happy for the VOA and very angry about "yet another
example" of how a little back-room dealing and ego-stroking can get

special government perks for government insiders that private citizens get laughed at for requesting.

Now that the FCC has relented on this one, does that mean that they are going to get deluged with requests from other government agencies? Will the president start signing Executive Orders to grant special callsigns for them too? Will some enterprising ham with the time, energy, and money now undertake a lawsuit against the FCC to force them to give to all what they have now only given to a few?

>To our knowledge, this is the first time since the adoption of
>FCC Rule 97.17(f) that a waiver has been granted.

>The license for the new call sign K3VOA was mailed from the FCC
>office in Gettysburg, PA on May 7th.

Congratuations! (I hope you choke on it :-)

Followups to *.policy.

>consumer's equipment so that it will operate properly. The *only* time

Most of the books I've seen (License manuals and assorted other ham books)
say that the ham should NEVER modify someone else's equipment to solve
interference problems, but that he/she should recommend having a qualified
technician do it. If the ham modifies someone's equipment they run the risk
of being blamed for any malfunction, even if the problem has absolutely
nothing to do with the modification. Unfortunately, in today's
scientifically illiterate society, people will blame malfunctions on just
about anything!

Hi all, I am kinda having a minor crisis here.. as I mailed to Box 88
MONTHS (Try 3 letters since July 1991.. I know I know.. unrest and all)..

But no reply.. and I NEED a R-150-S country list.. as the CQ-Ms are
this weekend.. not going to be a serious effort.. but really wanted the list.
Does anyone have one electronically.. or can point me in the right direction..
Or email me if you have it on paper and could possibly arrange a FAX??

Message-ID: <7MAY199221260553@erich.triumf.ca>
Source record: 290192

Someone recently asked for the frequencies of the Marine VHF channels. (Should this be in an "Annually asked Questions list? :-))

Here is a list, with a bias in the usage list towards Canada, West Coast....

Marine VHF channel frequencies and usage

Chan	Ship Tx	Ship Rx	Area	Use
01	156.050	160.650	IC	Ship/shore - telephone
02	156.100	160.700	IC	Ship/shore - telephone
03	156.150	160.750	IC	Ship/shore - telephone
04	156.200	160.800	I	Ship/shore - telephone
04A	156.200		C	Canadian Coast Guard - authorized stations
05	156.250	160.850	I	*Ship/shore - telephone
06	156.300			Intership - Safety
07	156.050	160.650		*Ship/shore - telephone
07A	156.350			Intership-Ship/shore - commercial
08	156.400			Intership - commercial
09	156.450			Intership-Ship/shore
10	156.500			Intership-Ship/shore - commercial
11	156.550			Vessel Traffic Management
12	156.600			Vessel Traffic Management
13	156.650			Bridge to bridge - 1 watt - Safety of Nav.
14	156.700			Vessel Traffic Management
15	156.750			EPIRB Buoy
16	156.800			- authorized stations
21B	161.650		C	Canadian Coast Guard - Weather Broadcasts
22	157.100	161.700	I	*Port Operation

83A 157.225 A *Intership, Port Operation (USCG)
84 157.225 161.825 Ship/shore - telephone
85 157.275 161.875 Ship/shore - telephone
86 157.325 161.925 Ship/shore - telephone
87 157.375 161.975 Ship/shore - telephone
88 157.425 162.025 IC *Ship/shore - telephone
88A 157.425 A *Intership

The channel usage marked with an asterisk (*) are from tables in Icom IC-M2 and IC-M55 marine radio manuals, and are probably fairly "generic", and subject to change in different jurisdictions. Other channel usage is from my station licence for the Canadian West Coast, and from things overheard on the air. "Your usage may vary."

Channels marked (CCG) or (USCG) are for Canadian or US Coast guard authorized stations only.

Channel 70 is supposed to be reserved for a future selective calling system, but is (illegally) being used for intership communications (even by the RCMP!)

The letters under "area" mean:
I: International only (non-US) according to Icom
C: Canadian usage
A: American usage

Channels with an "A" suffix are simplex operation on the ship transmit frequency of an international duplex channel.

Canada uses a "B" suffix to denote broadcast (one-way) use of the shore transmit side of an international duplex channel.

There are no repeaters (as hams know them) in the marine service (so far as I know). If you are willing to pay for a phone call, the telco might let you place a call to another vessel on the same (or different) channel, and so get the effect of a repeater.

1867. Mobile rig locks up bank teller computer

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 06:19:57 UTC
From: cberthel@cc.utah.edu
Message-ID: <1992May8.001957.1@cc.utah.edu>
Source record: 290194

Just wondering if this is a common problem. A friend recently visited the drive through window at the bank. While waiting for teller to take care of his transaction, he was talking on his 2m mobile rig. The RFI from his rig caused the bank teller's computer terminal to lock up. As soon as he quite transmitting, the terminal was okay. Then when he transmitted again, it interfered with the bank terminal again. Is this the ham radio's fault? Or was the computer poorly shielded for RF?

Cheryl - N7XHZ

To all radio amateurs

SB DX ARL ARLD023
ARLD023 DX news

Thanks to Paul, KB1BE, and the Connecticut DX Association for the
following DX information.

MALYS VYSOTSKI, 4J1. Better known as M-V Island, this one is
scheduled for a two week Dxpedition, again using the call sign
4J1FS, from May 26 to June 9. The operation was organized by club
stations OH2AQ, OH1AF and UZ1AWT. It will feature five stations
simultaneously, all bands and modes, including the WARC bands.

Frequencies for CW operation are 1832, 3501, 7001, 14025, 21025 and
28025 kHz. Look for them on SSB around 1852, 3795, 7095, 14195,
21295 and 28495 kHz. check the WARC bands on 10105, 18069, 18145,
24891 and 24945 kHz. RTTY is planned for 14084, 21084 and 28084
kHz.

A 23 operator team is planned for this operation. Stay tuned to
W1AW for QSL route information.

CP, MOZAMBIQUE. Look for C9RTT on 28465 kHz around 1250z and C9RDM
in the same general 10 meter SSB area at around 1455z.

ITU, GENEVA. 4U7ITU will be operated by I1YRL and IK1PML on all
bands with cw being the only mode. This event will be held on May 9
and 10.

8R, GUYANA. G4SMC/8R1 will be active May 20 for a two week stint.
He plan an all band effort, 80 through 6 meters, with CW and SSB.

CQ M CONTEST. This annual Russian contest runs this weekend.
W/K/VE stations send signal report and serial number beginning
with 001. This is a better than good opportunity to work some rare
```

DX countries and Oblasts. See April 1992 QST for more information.

> Will it work OK or will the strips of wire in the "Protoboard" tend to
> radiate, possibly making it fail?

I think you're talking about either breadboards or veroboard. You can remove the components from
a breadboard and re-use them, whereas you solder the stuff into a veroboard. Is one of these
right?
Either way, I doubt it'll work. At the very least its performance will be unpredictable. My guess (as a constructor with little experience) is that apart from the possibility of strips
radiating, you will get unwanted capacitances and impedances in the circuit.
I am building a 30Mhz frequency meter from a kit at the moment. There are about 20 ICs in the
kit and I wanted to socket them, but the instructions *specifically* say not to. I presume that
the PCB was also designed to eliminate stray capacitances and I reckon I can't use sockets for
the same reason. The instructions are also very particular about the way the PCB is wired.
My guess is that these problems will be exacerbated at the much higher frequencies used in the 2m band. I think you'll have to look at designing your own PCB, but I'm open to correction
on this one.
Best wishes,
Simon Woodworth.
(eeiswh@eeiua.ericsson.se - don't blame my employers for anything I say!)

>they did not state what the 'standard duty' one would manage!

Err, no. 25 W AM carrier gives 100W pep. My rig is similarly specified. It is also specified 100% key down 100W CW and FM. The PSU I use will handle this, but a lighteweight 50% overrated PSU may be just as good. You need to see how the duty cycle is measured. Running FM for 5 mins TX then 10 min RX may be stated at the limit. TXing for more than 5 mins at full power seems a little pointless. Either too much waffle or a very slow information transfer.

I would be very much interested in a comparison between the FT-990
and the Kenwood TS-850SAT. The reviews in QST suggest that the
receiver of the FT-990 is considerably worse than that of the TS-850.
Is that true and how do the two rigs compare with regard to ruggedness?
Considering that I work almost 100% CW (including DX and contesting),
which is the one I should buy?

Thanks and 73

In article <1992May7.232119.9638@cbfsb.cb.att.com> 5rtrtrt@cbnewsf.cb.att.com (richard.e.stealey) writes:
...
Actually, ARRL began publishing 3rd order intercept a few years ago, along with dynamic range, and it is the figure that should be used to compare receivers because it is an absolute figure, not one that is relative to the noise floor. Look at 3rd order intercept, and look at sensitivity if you need to and you have a good picture of the receiver and the way it will perform in both a strong and weak signal environment. Look at dynamic range and you will get confused!

Well, both are useful. 3rd order intercept is an absolute measure, but it measures the point at which the IMD products are a loud as the signals themselves; by that point, you've already "gone to hell in a handbasket". In particular, by the time you get to 3oIMD signal levels, you've already probably suffered tremendous desense.

All you have to do is add two numbers to get more useful information out of the dynamic range numbers. For example, here are a few figures from the ARRL lab tests which someone was kind enough to post last year ("preamp on" numbers, I believe):

QST | Xmtr | Rcvr
Rig Review| Harm. Spurs IMD | Min Sig BlkRng IMD DR 3rdO Icpt
Issue | dBpep dBpep dBpep| dBm dB dB dBm

IC-745 09/85 -65 -65 -35 -140 115 92 -3
IC-765 12/90 -64 -64 -40 -142 146 96 +2
HW-9 07/85 -42 -42 -128 122 88 +4
Omni V 11/90 -62 -48 -33 -135 135 95 +6.5
Paragon 05/88 -56 -61 -33 -137 136 101 +12.75
TR7/DR7 05/79 -46 -52 -33 -133 120 84 -7
TS-440 12/86 -65 -43 -28 -139 111 89 -6.5
FT-747 08/89 -54 -60 -32 -136 109.5 90 -1
FT-1000 03/91 -60 -45 -36 -136 137 94 +5

Add the MDS to the DR numbers, and you get the "onset" numbers for Desense and IMD:

Onset Onset
Rig Desense IMD
dBm dBm

IC-745 -25 -48
IC-765 +4 -46
HW-9 -6 -40

Omni V +0 -40
Paragon -1 -36
TR7/DR7 -13 -49
TS-440 -28 -50
FT-747 -26.5 -46
FT-1000 +1 -42

Each of these two numbers, and MDS, tells you something. Since IMD is a problem much before desense, desense isn't likely to be an issue except in a single-strong-signal environment. Also, IMD products tend to get bad very quickly with sources above the onset of IMD, so the IMD floor is very important when trying to pull out weak signals in the presence of strong ones (e.g., contest situations, 40m).

It would be difficult, though not impossible to build a 2M receiver on a proto-
board. The reason being that the stray indictance of all the wires on the
protoboard will end up affecting your circuit. Though I have never used it,
I understand that the 'dead bug' style of construction, where the circuit is
build using an unetched copper clad board for a ground plane, and soldering
the components directly to each other and the board works well at high freq-
uncies. This months QST has a project using this type of construction if you
want more information.

Message-ID: <9205081219.AA25820@ucsd.edu>
Source record: 290203

A few years ago someone tried to build a 25 Mhz 250mw LASER driver using
a protoboard. It was a mushy mess. Difficult to drive. Cross coupling
nightmare. All our prototyping now gets done on D.S. Cu Vector board with
the ground plane removed from under rf conductors (to reduce capacitance).
Find a circuit board. It will be fairly easy to play with the
'spokes' since the wheel has already been invented.

1878. Kenwood TS-120S Problems

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 12:32:12 UTC
From: hatzakis@fovea.stanford.edu
Message-ID: <HATZAKIS.92May8123212@fovea.stanford.edu>
Source record: 290142

Holt:
I have had the same problems. It is a bit tricky to fix, but I did
it without anything too fancy. If you want, send me your address and
I will send you the tech bulletin, or you can contact Kenwood and they
will send you the update or hang on, I'll just describe it to you...

The problem is RF getting back into the radio and the follow steps
will help:

1. Check the tightness of the Coax connector at rear. It has to be
real taught

2. Check for any loose screw in the internal boards, make sure they
are grounded well.

3. Check Diodes D2,D3 and D8 for high reverse leakage. I just ordered
them from kenwood and replaced them. It is tricky, but is worth the peace
of mind.

4. Make sure the following values are on the board, if not, change
R47 = 10ohms (was 33)
R50 = 680ohms (was 680)
C61 = 220pf, should be removed
Add 2 1s1587 (V11-0370-05) in series from junction of C4 and D8
(also, 1S1587==1s1585)

The white/Brown AVB line that runs from the filter unit to the RF unit
needs to by bypassed with a0.01uF cap. There is a place that you can
move over some wires on a post and use the remaining post to bypass
this line.

Give it a try, but it worked for me, and I had a bad problem with
oscilation.

Good Luck, Mike WB2TBQ

1879. Satellite Tracking: Help!

I'm trying to reconcile the Keplerian elements provided on Internet with the tracking procedures referenced in Taggart's weather satellite book so I can predict Mir orbits (packet stuff).

I include below a sample Kep set and what I've done in trying to extract this information in the form used by Taggart. He does show how to deal with extracting the nodal perdiod from the mean motion data in the Keps. However, I can't determine where to get the longitude of the ascending node info, and I'm not sure if I've done the other calculations correctly. Could someone check these for me?

Mir

This is the most incredible sour grapes posting I have EVER SEEN!! Of COURSE exceptions get made! Such as where and when Air Force One can land. And so the FCC's a little tighter than everyone else. How many agencies have 500,000 special cases sitting out there just waiting for a crack in the veneer? If ever an exception was going to be made, I think this was the right one. I certainly do not think this should open the door for every out of date call-sign to be reissued to Joe Ham or the Good Ol' Club, or for me to get my old K4 call back (which I, too, would kill for). Let's have a little perspective here.

>How can I obtain recipercal licensing for amateur radio?
^^
The ARRL can provide the information and necessary forms to obtain a
recriprocal license. I am not sure if they provide the stuff to just
members or also to non-members.

You will find that getting a recriprocal license may not be cheap. If I
remember correctly, Great Britain wants someting like 25 pounds for one.
The main concern here is to get any application in three months or so
before you plan to be in the country as I understand it can take some
time to get the license.

Contact the ARRL and good luck!!!

So do I if there is any chance of a thunderstorm -- this is only good practice. Also, a forgotten item is the rotator cable; put a connector in it near the rig so it can also be disconnected. I agree with the unplugging the AC line; do it! To prevent any damage from arcing due to a strike, place the disconected end of the coax in a glass jar.

It is not that difficult to do and certainly cheaper than buying all kinds of lightning protection gear. Our club had a program given by an expert in lightening protection and he gave good advice about what will work and what won't and how to protect your gear (it is not as easy as you might think). I told him I unplugged everything and he said that should provide the best protection one could get. However, my ground cable is still connected to the ground bar in the main service box, so there is a potential if lightning gets into the AC lines in my house. But then I wouldn'd have need for my ARRL insurance if it would be impossible to have damaged equipment, would I?

Lightning is not predictable and I don't believe any manufacturer who says any device will stop it.

I mistakenly thought everybody knew... well since that was an incorrect assumption -----
My TS-440S talks to me in English or Japaneese (depends on a switch setting on the inside of the radio) and tells me what dial frequency I am on when I press a button marked "Voice". And when I press a mode selection switch, it tells me in cw which one I just pressed. The add-on module for the voice readout is an accessory, and many Kenwood products have it available. Because of the technology and fascination with bells-and-whistles, probably any recent (last 5 to 6 years) radio has the capability. Look in the Ads under optional accessories. Good luck. Severl seeing impaired hams here in Rochester New York successfully use the TS-440S for SWL'ing and SSB and CW amateur communications.

Interesting. I assume Gary is referring to the lower bands-145 and 436
MHz, and not the 1269 MHz band. The M57762 used for 23 cm seems pretty
rugged, and is rated in the spec sheet to withstand a 16:1 VSWR. I've
not performed destructive testing, however. Of course, coax losses on
23 cm can make even an open circuit look halfway decent at the transmitter.
Most of my experiences are with this power module used in other places
besides the TS-790, though I know the 790 uses it.

I use DC switching for my remote 70 cm amp/preamp. Its pretty easy to
multiplex a DC voltage with 70 cm RF. Must admit that building TR
sequencers does get boring...but I don't like hot switching relays

>is either 150 ohms, or 16.66 ohms. Now a quarterwave section of 50 ohm cable
>will transform a 150 ohm impedance to 86.6 ohms. That's a much better match

Gary has transposed the numbers. An 86.6 ohm quarter wave
cable will transform the 150 ohm impedance to 50 ohms. The 50 ohm quarter
wave cable will transform the 150 ohm impedance to 16.66 ohms

Zo (quarter wave matching section)= (Zinput*Zoutput)^0.5

A common example is to use 70 ohm cable to match 100 ohms down to 50 ohms.
As a quick check, the matching section impedance is always BETWEEN the
input and output impedances.

Zack KH6CP/1

>to 50 ohms than 150 ohms. Sure the *cable* may have an SWR of 3:1, you're

I've come to the conclusion that G5RV himself never used a 4:1 balun with his famous antenna. Of course, the transmitter he originally used with the antenna wasn't even 50 ohms, according to the RSGB article I looked up.

1887. Uplink frequencies for RS-12/13.

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 14:24:33 UTC
From: alan@bambam.es.com
Message-ID: <1992May8.142433.25851@dsd.es.com>
Source record: 290210

Does someone on the net have the uplink frequencies for RS-12/13, and is anyone active on the birds? I tried to get a signal through RS-12 yesterday and had no luck, so I am not certain that I was on the correct uplink frequency. I heard several stations on the RS-12 downlink including an Italian station (I think it may have been mode K). I heard U.S. stations calling CQ RS-12, one on CW and one on SSB, so RS-12 seems to be alive and well. The reason for all of the sudden interest is that we are going to try to make a few QSOs through RS-12/13 on Field Day this year, hopefully using unsophisticated equipment. We have two near-overhead passes during the Field Day period. Please post any replies to the net so that others will have the information and hopefully give RS-12/13 a try. Thanks...

No, not sour grapes. This is not an example of special privilege for a public purpose (as is executive transport with special equipment) this is an example of special privilege for the purpose of allowing these members of the government to pursue their hobby in a way more to their liking. On taxpayers time and money yet!

The excuses for these excesses just won't do any more. Throw the bums out!

Sorry to include both previous posts, but I couldn't find a good place to truncate either of them.

Gee whiz Paul. If you really didn't want it to sound like a sour grapes attitude then you really should have taken more time to reword it before sending it.

Every now and then someone or some entity comprised of people may test the waters for a change in policy. They may do this by making "one time only" exceptions, or by other means. Their decision whether or not to ever do that kind of thing again, much less expand it, may hinge in large part upon the response received from that test.

If that is the case then I believe that the *WORST* thing to do would be to criticize them for the action. Instead, appriciative, suportive positive responses should be send to the FCC, without prematurely demanding any further relaxation of the existing rules. Later, at the "appropriate" time, this case could be mentioned and used to support such a request.

Imagine, if you will, a dozen hams in a town waiting for variances to begin erecting their 100' towers when there is an existing limit of 50'. If the board granted ONE and didn't rule on the remaining eleven then what do you think would be the best way to proceed?
Shout "FAVORITISM" and "THROW THE BUMS OUT"
Demand that the remaining 11 be granted immediately
Wait until the tower is erected and use it as an example

I think that the last example would be the best, especially if it's a good installation without neighbors complaints. You can point to the boards wisdom and good judgement. You can commend them for being community minded. You can use POSITIVE words to make your case.

Congratulations to the VOA on their 50 years of service and to their ARC for their commerative effort.

If the FCC would ever reconsider it's ruling on it's callsign policy I'd probably just keep the old tech call anyhow... I've gotten accustomed to it.

1890. Pro-2006: 3 Questions

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 15:02:10 UTC
From: pas@jupiter.ic.cmc.ca
Message-ID: <1992May8.150210.21312@ccs.QueensU.CA>
Source record: 290213
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc,alt.radio.scanner

Hello netters,

My Pro-2006 arrived from Grove! A great radio! Last night I
was searching around the 894 Mhz area and picked up airline phones!
I wasn't sure if I would need all the features of the 2006 but
certainly don't regret getting them now... for example, to pick
up these airplane phones, I had to change the receiving mode from
narrow FM to AM... no problem with the 2006!

Anyway, I have three questions:

1. When listening to cellular phones in both the 830-850 range
(mobiles) and 870-890 range (base), I get a high pitched whine
from the speaker whenever a transmission is coming through.
It's not very loud, varies with the volume control and is
certainly in the upper half of the human frequency hearing
range. What's interesting is that there is no such
whine from the radio when listening to some trunking
communications near 860 Mhz suggesting the radio is working
OK since I presume the same circuitry is being used.
Anyone notice something similar? Anyone have a circuit
for a low-pass filter or tone control I could put in the
audio path?

2. The sound squelch doesn't work on all birdies published in
the owners manual? This is contrary the excellent
review of the Pro-2006 by Bob Parnass. Have you noticed
this in your 2006?

3. A challenge for circuit designers: I would like to add
CTCSS tone decoding (PL tones) to the radio. This is
no problem if you want ALL channels to only break squelch
on reception of the proper PL tone: just buy a $59 board
from Communications Specialists and install it. I did
this to my old Pro-2003 and it works great. Now I would
like CTCSS/PL tone decoding on my Pro-2006 but ONLY on
one of the ten 40-channel banks... So what I need is
some signal from somewhere in the radio that indicates it
is scanning in say bank 361-400, for example. I could
then use this signal to enable the CTCSS card for that
bank. The big question is: from where in the radio
can I tap a signal which indicates it is scanning in the
361-400 bank? I've thought of two options, neither
very attractive:

a) watch the address bus of the RAM chip and trigger
on the starting address of the stored channels
of the bank. This means finding out the memory
map of the CPU and how frequencies and their
attributes (delay, NFM, WFM, AM etc) are stored.
Probably not easy.

b) programming channel 361 and 400 to some quiet
frequency and in WFM (wide FM) mode. Then I
could watch the WFM output pin of the CPU to toggle
my CTCSS card on/off. Problems: can't use WFM for
anything else and it's possible the WFM pin changes
for other reasons.

Any help on these three questions would be appreciated!

Peter Stokes

UV doesn't really affect Nylon. It breaks down polyurethane rope in short order. Nylon, however, stretches easily and can break. Dacron rope is rather UV immune and doesn't stretch much.

Good advice. Wrong reasons.

The rig is supposed to oscilate on the the band is set too :-).
I assume we are talking SSB here and the problem is that there is
substantial signal on the output even when none is present at the input.

Sounds like maybe RF feedback. The transmitted RF is getting back
into the rig. I had this problem with my TS440 when I first brought
it home because it was pooring down rain and we wanted to kludge
together something to play with it so we built a whip antenna out of
the mobile antenna section of the ARRL handbook and grounded it to the
third pin of the electrical outlet. Some much RF that the rig
wouldn't unkey itself after you let up on PTT. Didn't get much
signal out, either. We also managed to fry the output transistor in
the keyer.

Is this rig grounded? Is it connected to some semblence of an RF
load? Did somebody monkey with the microphone cable? I'd try it into
a Dummy load if you haven't tried that already and recheck the
grounding. What are you using for a power supply? How does the rig
perform in other modes?

ZCZC AE85
QST de W1AW
DX Bulletin 23 ARLD023
>From ARRL Headquarters
Newington CT MAY 8, 1992
To all radio amateurs

SB DX ARL ARLD023
ARLD023 DX news

Thanks to Paul, KB1BE, and the Connecticut DX Association for the following DX information.

MALYS VYSOTSKI, 4J1. Better known as M-V Island, this one is scheduled for a two week DXpedition, again using the call sign 4J1FS, from May 26 to June 9. The operation was organized by club stations OH2AQ, OH1AF and UZ1AWT. It will feature five stations simultaneously, all bands and modes, including the WARC bands.

Frequencies for CW operation are 1832, 3501, 7001, 14025, 21025 and 28025 kHz. Look for them on SSB around 1852, 3795, 7095, 14195, 21295 and 28495 kHz. Check the WARC bands on 10105, 18069, 18145, 24891 and 24945 kHz. RTTY is planned for 14084, 21084 and 28084 kHz.

A 23 operator team is planned for this operation. Stay tuned to W1AW for QSL route information.

CP, MOZAMBIQUE. Look for C9RTT on 28465 kHz around 1250z and C9RDM in the same general 10 meter SSB area at around 1455z.

ITU, GENEVA. 4U7ITU will be operated by I1YRL and IK1PML on all bands with cw being the only mode. This event will be held on May 9 and 10.

8R, GUYANA. G4SMC/8R1 will be active May 20 for a two week stint. He plan an all band effort, 80 through 6 meters, with CW and SSB.

CQ M CONTEST. This annual Russian contest runs this weekend. W/K/VE stations send signal report and serial number beginning with 001. This is a better than good opportunity to work some rare DX countries and Oblasts. See April 1992 QST for more information.

QST de W1AW
Propagation Forecast Bulletin 19 ARLP019
>From Tad Cook, KT7H
Seattle, WA May 9, 1992
To all radio amateurs

SB PROP ARL ARLP019
ARLP019 Propagation de KT7H

The sunspot cycle hit another low this week. On May 3 the
solar flux dropped to 125.6, the lowest since nearly two
years earlier on May 4, 1990. The only disturbed day was
May 2 when a minor flare drove the Boulder K index briefly
to 5. Otherwise propagation was fair through the week.

At this stage of the cycle numerous small simple sunspot
groups appear briefly, only to fade away. It is clear
that we are seeing a drop in activity as the solar cycle
heads toward the next cycle minimum. Solar indices will
decline over the next few years as we fade from the cycle
maximum in July, 1989. We can still expect brief periods
of intense activity, particularly from recurring coronal
holes on the solar surface.

The solar minimum for the month should occur around now,
and the solar flux should climb again toward a peak near
180 around May 16. Another minimum should follow around
the end of the month. A slight increase in geomagnetic
activity is possible around the 15th to the 18th of May.
Some forecast models suggest a temporary increase in
solar activity from late May until July.

Sunspot Numbers from May 1 through 7 were 114, 109, 107,
136, 128, 135 and 135, with a mean of 123.4. 10.7 cm
solar flux for the same period was 130.9, 135.8, 125.6,
134.7, 133.0, 130.6 and 129.1, with a mean of 131.4.

1896. Re: DSP is _____?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 15:18:57 UTC
From: n4hy@idacrd.UUCP
Message-ID: <1310@idacrd.UUCP>
Source record: 290218

From article <1992May6.124134.4497@iscsvax.uni.edu>, by simmons5275@iscsvax.uni.edu:
> Excuse me if this is a dumb question, but I am new to this hobby.
> Anyway, what the $^%#$%# is DSP? It is so anoying to hear
> others talking about something that youdont have the slightest clue
> what it is!
>
> rob

Rob:

DSP stands for Digital Signal Processing. In the simplest possible terms, it is taking an analog waveform, and turning its voltage amplitude into a number, and then handing this sequence of numbers (called samples) to a computer for processing. In most cases these days, when you hear DSP talked about in this news group, you are talking about the computer being a special purpose microprocessor, especially designed to run like a bat out of hell, doing the jobs necessary to do fancy signal processing. It is called digital since the analog waveform has been turned into a digital representation. This is done with an A/D or analog to digital converter chip. The reverse process is done with a D/A and usually passing through a filter afterwords to smooth the waveform. The reason for all the hullabaloo is that these DSP chips have become more affordable, commercial companies are putting them into multimode boxes, and targeting them for the amateur radio market (such as AEA and its DSP2232).

Hope this helped.

Yup, throw the bums out. Then the positions will be vacant. Then they'll get filled by the people who weren't chosen the first time. That'll make sure that the quality of government declines even further.

Is that what you really wanted? Are you saying you'll provide a suitable candidate (yourself, perhaps) who will be better than the previous crop? Or are you just being a short-sighted slogan-chanting reactionary fool?

People get the government they deserve.

>>How can I obtain recipercal licensing for amateur radio?

> recriprocal license. I am not sure if they provide the stuff to just

Is that "reciprocal"???

Are hams such poor communicators because they can't spell? Hell, half the hams on packet can't even find the shift-lock key to turn it off!

Going to hell in a handbasket, that's what we are. It's a large basket. Getting larger all the time.

Obligatory helpful advice: The ARRL has some information on reciprocal licensing. Call them. You might also contact the tourism bureau or embassy for the country you're thinking of visiting.

I can take most local DEBOLD ATM machines out of service by using
my HT near them. Radio looks clean on a scope so I guess I am getting into
some sort of anti-tamper circuit.

1900. Re: Antennas and lightning

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 15:57:33 UTC
From: brian@ucsd.edu
Message-ID: <ue8ddINNluc@network.ucsd.edu>
Source record: 290222

If your antenna are all DC-ground and coax-fed, it should be sufficient to THOROUGHLY ground the coax shield at the entry point to the building.

In commercial mountaintop radio sites, there is typically an entry panel which consists of a thick metal sheet that is very well grounded, and all the coax going in the building is connected to bulkhead connectors to feed through the panel. The key to this is using immense short ground connections to a very good ground. I believe you can even get bulkhead coax feedthroughs that incorporate an integral spark gap lightning protector.

I think I'd use telephone line protectors for rotator cables; they're commonly available and not very expensive. A three-pair model would handle the six wires most rotators need; models up to 25 pairs are available if you have a lot of wires to protect - circularity switching relays, preamp power, etc. I'd probably chose one of the models with carbon spark gaps, gas discharge tubes, and internal fuses.

You know, your local library has probably got a lot of information on this subject. I've attached below a subject retrieval for "lightning protection" from our on-line library catalog for the UC system.

1901. DSP2232 modems

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 15:57:37 UTC
From: n4hy@idacrd.UUCP
Message-ID: <1312@idacrd.UUCP>

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet

Howdy:

I have been on a roll of late. The KAM killers are done. I delivered
to AEA all the dual port modems they wanted and am now working on a
couple they didn't ask for, and then finally I will attempt the ones
that are probably not doable.

The DSP2232 now does

dual port VHF/VHF Packet
dual port VHF/HF packet
dual port Baudot / VHF packet
dual port AMTOR / VHF packet
etc. All the ones KAM claims in its ads that it alone does.
I am doing some it is not (yet) capable of

dual port 2400/VHF Packet (this is V26B and I will call it that)
dual port V26B/HF packet
dual port Baudot/V26B
dual port AMTOR/V26B.

The ones I think MIGHT be possible, but have not yet attempted include

dual port G3RUH/G3RUH (or K9NG/K9NG 9600 bps if you prefer).

This requires a note. My 9600 bps modem in the DSP1232/DSP2232 are
the ONLY 9600 bps modems with an adaptive equalizer on the receive side.
It adapts quickly enough to use it locally on my 9600 bps bulletins
boards and digi/nodes. These guys are running txd's around 20ms
and the thing adapts quickly enough to easily handle that. I will describe
the thing in detail in another forum. (Thank goodness K9NG had the
foresight to use a scrambler). The eye pattern is displayed on the
tuning LED's on the front panel on all my modems (the one with two
data states), and the G3RUH lights two LED's with a BIG black hole
in the middle. This signifies the opening of the eye with the
adaptive equalizer. Why did I do this? UOSAT left the UO22 transmitter
in a mess. It is badly distorted as the transmitter spectrum has a
well at DC. The eye patterns in the raw signal are 50% shut. This
is enough to recover timing but is trouble when the signal gets much below
loud. This adaptive equalizer opens the eye more than enough for me
to get 5 times the copy of the old modem (not only myself but KA2MOV,
KE7GH, and N6KK report similar results) and at my location it reads
about 15% more than my NB96 (G3RUH by PacComm). The reason for the
detail about this is that this will be the thing that goes first
when I run out of processor ticks trying to do the dual port 9600's.

If I am required to do this, it will be clearly stated that you must use decent radios, with reasonably equalized signals out of the discriminator for it to work well.

Someone put a note on here about doing V.29 through a microphone jack with a telephone modem chip. That served as a major impetus to try it. If a chip designed to do this on a telephone wire can do it, I can beat it with the DSP2232, and will attempt to do so. It would be nice to do 9600 through the mike jack rather than off the discriminator.

I have completely revamped the WEFAX, and SSTV modems. WOW! I wrote an application for the PC that takes WEFAX DSP2232 output and displays it. 600 pixels per line, no timing information is encoded so the picture slides and phasing must be maintained for now with the help of your finger on cursor keys. Never mind, the charts and weather pictures coming out at 16 shades of grey(more than they encode originally, just convenient) are outstanding!! I can't wait for Steve (N6IA) to get his new analog mode done so that I can get the SSTV stuff on the screen. The demodulated waveforms on the oscilloscope look great but we need this mode for it all to hang together. This will transmit and receive. The unit is now fully rated at 38400 bps on the serial line to the computer BIDIRECTIONAL. I have written a terminal emulator and display software (my first big assembler programs ever) and it all seems to glue togther. This is too exciting.

It won't work. Protoboards are notorious for bad grounds, ground loops and quite a few other things. You can build small circuits to debug at low frequency but at high frequency and power you're asking for trouble.

Good Luck,
Bob, WB0NSA, <kressig@mcopn3.dseg.ti.com>

I prefer the ARR preamps myself, *but* the good ones don't offer *any*
RF switching. So if you want to be able to operate both mode B and mode
J, you need external sequencing relays. The sequencer can be a simple
switch in the shack since you only have to flip it when you change
modes, but I also use the setup for terrestrial work so I prefer an
automatic sequencing system. It's safer too, you never have to worry
about forgetting to throw the switch. I have the system setup so that
when I power down the station the preamp is switched *out* of the line.
That gives a little peace of mind when lightning comes lurking. BTW
the relays are setup to *terminate* the preamp's input and output in
50 ohm dummy loads when not in line. The ARR preamps are very hot and
they are *not* unconditionally stable when they see a non-standard
load.

For those who don't know, ARR offers RF switched preamps in addition
to their standard receive only models. I don't care for their choice
of relays, nor do I like the spike of RF that hits the GASFET before
the relays engage. GASFETs can gradually degrade from such spikes
until you have an attenuator rather than a preamp up at the top of
the tower. I went through 3 of them before I designed my own system.

>with AGC following fast fades that SSB or ACSSB has.

I agreed about the AGC problems and the squaring loop threshold, though
they can both be mitigated with proper time constants for continous
speech. You can get 6 db improvement in single channel interference
rejection though by using pseudo-Weaver phasing in your detector, not
just the 3 db of a less ambitious detector. That advantage, plus no
Donald Duck, makes the system attractive, especially for naive commercial
users who don't want to fiddle with a clarifier. In commercial use signals
aren't likely to be extremely weak and the bandwidth conservation makes
the system an attractive option over NBFM where FM improvement is much less
than with WBFM.

OK, perhaps subtlety doesn't come across too well in a written form. If
my sarcasm, smileys, and worst-case "what-ifs" got misinterpreted, then
I apologize.

While I agree with another poster that we should respond to this
happening as positively as possible, and the hopes that the FCC will see
the light and open up more of the callsign blocks for special cases, I
am very concerned that the FCC has acted arbitrarily. Without special
policies for issuing such callsigns, the agency is potentially opening
up a serious can-of-worms. The FCC has abandoned its previous policy
(i.e. "Forget it!") and has left itself open to charges of favoritism.

Computer automation has advanced by leaps and bounds. One of the
principal justifications for denying PRB-3 (and implementing a
long-overdue, but paper-trail intensive, No-Code technician license) was
the entrenched Honeywell mainframe-based license tracking system. With

the recent contract by the FCC to upgrade its systems (check the Ham-Policy digest archives for more information), maybe better, more maintainable systems combined with special enabling legislation, could make special-event callsigns a reality again. (We already have special legislation providing for the issuance of club license again. How is that coming?).

If you mean the white plastic things that you can buy at Radio Shack, not only can't you build a 2m radio with it, you can't even build an 80m radio!!! The parasitic capacitance between traces is horrendous -- I once tried to breadboard a 3.57MHz crystal oscillator using one, and was surprised to find it oscillating at about 1.5MHz -- all on parasitic reactances...

The PC-board version of protoboards that RS carries might work well enough for HF, but I'd be mighty suspicious at 2m.

It is certainly the terminal's fault. He should call the bank and let them know (since that probably means the ATM is radiating out like crazy), and maybe suggest that some OTHER enterprising CB or cellphone operator might figure out a way to make the machine cough up money for free using interference (unlikely, but it'll likely scare the bank to think that anyone with a cellphone even MIGHT be able to crash the ATM).

Thanks for posting them. I would however like to point out to those who may only get this version is they will change. Endeavor will going through a series of orbital maneuvers to intercept the Intelsat. After Intelsat is repaired and put back out, Endeavor will be moved to a different orbit. NASA's Spacelink (telnet spacelink.msfc.nasa.gov) will post the ones for the rest of the mission, after Endeavor finishes its sat-grab.

A coaxial lightning arrestor would not have prevented this unless the
case of the arrestor were grounded to earth. But you could get the same
effect with a simple grounded barrel (double-female) connector. What the
lightning arrestor does is to limit the voltage difference between center
conductor and shield. If you ALWAYS disconnect the antenna when not in use
(and never operate during a lightning storm!) then you don't need the
arrestor. (However, the arrestor is highly recommended for absent-minded
people like me!)

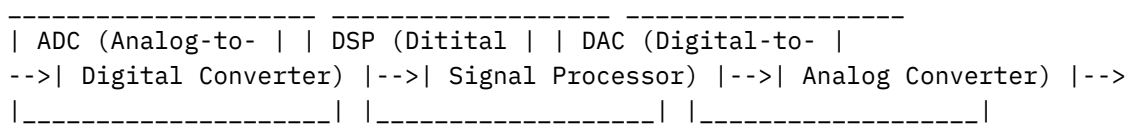
>Anyway, what the $^%#$%# is DSP? It is so anoying to hear
>others talking about something that youdont have the slightest clue
>what it is!

Say you want to build a CW audio filter. You could build a simple op-amp
circuit or you could go "high-tech" with a DSP-based system:



The ADC converts the input audio signal into a continuous stream of
digital numbers. Each number represents the input voltage at an instant of
time. The DSP is just a special-purpose microprocessor which performs the
calculations on the numbers to implement the type of filter you want.
The DAC converts the nubers back to a voltage which you can then amplify
and send to your speaker or headphones. Not shown, but usually required,
are low-pass analog filters before the ADC and after the DAC.

All this complexity would not make sense for a simple CW filter, but the
DSP is capable of far more sophisticated signal processing. For example,
DSP's are used in modems to convert digital data to/from the tones required
to send the data over a telephone or radio link. The advantages over
analog techniques are many: You can implement different modem standards
and baud rates (signalling speeds) with no changes in hardware. Fancy
adaptive equalization algorithms can correct for the frequency response
of the phone line or radio (again with no additional hardware.)
Noise filtering and detection algorithms can be more sophisticated than
with analog circuitry. Also the filters can easily be designed to have
no phase distortion, which is very difficult to do with analog filters.

>TR7/DR7 05/79 -46 -52 -33 -133 120 84 -7
...

That's the problem with not reporting the whole story. You can't alwyas
add the numbers as theory predicts and get the right answer. The TR7
actually has a Third Order Intercept of around +20 dBm. Evidently the
dynamic range in the ARRL tests was being limited by something else.

Also: Although theory predicts that third-order distortion falls 3 dB
for every 1 dB in signal level, in practice this is only an approximation,
and often not a very good one. You can plot the third-order intercept
point as a function of signal level -- you typically don't get a
straight line.

>Each of these two numbers, and MDS, tells you something.

Agreed. One thing I really miss in the ARRL reviews is noise figure.
MDS gets you close, but it depends on receiver IF bandwidth. Even if
they tell you what the nominal filter BW is, production filters vary
widely from their nominal specs. Also the noise bandwidth is different
from the quoted 6 dB bandwidth. This means that, using the published
data, you can only estimate noise figure to within +/- 2 or 3 dB.

I was really pleased to receive the YA5MM card in the mail the other day.
Very Prompt work.

This got me looking through the log and I have a few cards outstanding
that I'd like to followup on:

I worked OD5ZN on Oct. 19, 1991 and QSL'd via LZ1BB. So far no answer.
Is he slow or should I try again?

Also, worked HZ1AB during the CW DX contest on Feb. 16, 1992. No card yet
through K8PYD.

And finally, PY0FZ on March 15, 1992. I went through PY7ZZ.

These may be fairly common but for an FT101B barefoot and a ground mounted
vertical it's a big deal! HI HI

Thanks & 73
Steve/AA7FL

>...my W2E
>recently did the same thing. really annoying part was it happend really
>fast and I could not turn it off ! The W2 uses a keyboard button to turn
>on and off the rig.

My TH-77 does begins to beep faster and faster until the display blanks,
as the nicad cells die. To be able to power it off I disconnect the battery
by sliding it half-off, wait a little while, then slide it back on.
This is usually enough for the nicad to recover a bit, so that the power-off
button works. This may be unnecessary, but I haven't had it lose memory
contents in a long while.

1922. AURORA WARNING: Middle Latitude Auroral Activity Warning

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 22:03:06 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.705362586@honte>
Source record: 290146
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 22:00 UT, 08 MAY

/\

HIGH RISK PERIOD: 10 - 11 May (UT days)
MODERATE RISK PERIOD: 08 - 12 May

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >48 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW - MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: GOOD - FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

CENTRAL OREGON TO SOUTHERN IDAHO/EXTREME NORTHERN UTAH TO SOUTHERN
WYOMING TO SOUTHERN NEBRASKA AND POSSIBLY EXTREME NORTHERN AND
NORTHEASTERN KANSAS TO CENTRAL MISSOURI TO SOUTHERN ILLINOIS TO
SOUTHERN INDIANA OR POSSIBLY CENTRAL KENTUCKY TO CENTRAL VIRGINIA.

(The above line depicts the estimated absolute lowest latitude from which
auroral activity may be observed. The following line depicts the estimated
boundary of moderate levels of auroral activity under dark sky [ex. no light
pollution] conditions.)

MODERATE AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM

NORTHERN WASHINGTON STATE TO NORTHCENTRAL IDAHO TO SOUTHERN MONTANA
TO NORTHEAST WYOMING TO SOUTHERN SOUTH DAKOTA OR NORTHERN NEBRASKA TO
CENTRAL IOWA TO CENTRAL ILLINOIS TO CENTRAL INDIANA TO SOUTHERN OHIO
TO SOUTHERN PENNSYLVANIA AND PARTS OF MARYLAND, DELAWARE, AND MOST OF
NEW JERSEY.

(These lines are based on anticipated levels of geophysical activity. Actual
conditions may vary considerably both in time and space.)

SYNOPSIS...

A major class M7.4/4B solar flare erupted out of a well-placed region on
the Sun at 15:46 UT on 08 May. This flare had strong characteristics
indicative of a large coronal mass ejection. We are beginning to observe
positive signs of such an ejection at the present time, indicating an

interplanetary disturbance was successfully launched and is in transit to the Earth. The disturbance is expected to arrive near 03:00 UT on 10 May (give or take several hours) and produce fairly strong (minor to major) auroral storming on 10 May, possibly stretching into 11 May (UT days). Although the moon will be about 50 to 60 percent illuminated, conditions should be near-optimal for observing auroral activity after midnight on 10 and 11 May. The disturbance is expected to last approximately 36 to 48 hours, with the most energetic phase of activity enduring for 18 to 24 hours. If the disturbance arrives near the forecasted time, North America (particularly central and western areas) will be well-placed for observing the initial main phase of energetic auroral activity. If the disturbance is early, eastern North America should also be well-placed. However, if the disturbance is late, the Australian/New Zealand regions and regions of northern Europe will be best placed for observing the energetic phase of activity.

There is also a chance middle latitude regions will be able to observe auroral activity on 09 May (UT time, or the local evening of 08 May for North America). Levels of auroral activity have increased notably over the last 24 hours due to previous solar-initiated disturbances (unrelated to todays major flare). Activity has become energetic enough over some regions to be seen from the middle latitudes.

The present disturbance is expected to give way to substantially more disturbed auroral conditions on 10 May when the impact from todays major flare materializes.

** End of Warning **

1924. Yeasu FT-470 Mods...

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-08 22:46:00 UTC
From: jfs4892@zeus.tamu.edu
Message-ID: <8MAY199217464255@zeus.tamu.edu>
Source record: 290148

Does anyone know of any (good) mods for the Yeasu FT-470? I love the unit, and I have done the 2m rx extend mod for 130-180 MHz rx and 140-150 MHz tx. What I need are mods for 440...preferably rx & tx up to 470, at least, if they exist. (Needed for a job...they have their own freq - 463.525/468.525.. would like to be able to use my own unit in a pinch, if need-be.) Also, if anyone has any more good tx mods for 2m, send them to me, I'd like to take a look at them.
BTW, I also already have a "trick" mod whereby I can MANUALLY tune in any freq between 400-500MHz via memory tune, but that's a pain if it can be avoided. Send mods to JFS4892@zeus.tamu.edu...Thanks.

73
John, N5ZKC

DISCLAIMER -> I AM aware that tx outside ham bands is illegal, I just like to dabble/play with new mods, just for the heck of it. As for the 463.525 freq, I would already be authorized for that before I'd use it...Also, the 2m mods could be useful in the future for future jobs, like EMT....

1925. Re: License question...

>2-Do voice mail
>3-Do autopatch

Contact A/D Technologies (404) 992-2026

I have had the pleasure to use their
controller for the last year and have had a ball.

It is a board that plugs into a 286 machine (it will run on a
XT mchine) manyI/O lines analog and digital. It has
really good voice mail, complete remote control,
remote bas support, and many many other features.

It isn't cheap but the price/performance is the
best in the industry... I think the price is
arourd $1995, but call them to confirm.

No, I am not associated with A/D Tech, just satisfied
user.

>>You see, I ALWAYS disconnect my antenna from my radio when not using
> ^^
>
> So do I if there is any chance of a thunderstorm -- this is only good
^^

This is part of the point I was originally trying to make. At least in
this neck of the forest, the weather is a bit tricky to predict. I
remember one winter a sudden SNOW squall came up -- the snow was flying
everywhere. My family and I were suddenly startled by a very nearby
bolt of lightning in January! You just never know.

I suppose that if your weather is more predictable, and you ALWAYS
remember to disconnect your antenna if you leave the house (many times
one is delayed for a bit and inclement weather arrives) you might be
able to get away without a lightning arrestor, but I just wouldn't trust
myself that much. I would rather put the arrestor on to minimize (not
eliminate) the risk of mishap.

BTW - I have learned my lesson! I will 'never' say 'always' on the
internet again. I have been corrected. Now, I originally did my
follow-up comment to rib Al Bloom a bit. Al, you can gloat a bit... it
backfired nicely. :-) :-), 73, Ed.

True indeed. However, if there is ANY chance one might occasionally forget
this important step, other forms of protection do make for some added

'insurance.'

> my ground cable is still connected to the ground bar in the main service
> box, so there is a potential if lightning gets into the AC lines in

>
> Lightning is not predictable and I don't believe any manufacturer who
> says any device will stop it.

It can be done, but the cost is quite high. The purpose of a lightning
arrestor is to prevent equipment damage from NEARBY strikes.

Ah, aren't follow-up postings fun? 73, Ed.

>Cheryl - N7XHZ

It is not the ham radio's fault. The computer system probably has a label
that states, among other things, that the computer must not cause interference
to radio services and must suffer any interference that may be caused to
it. The FCC states in their Interference Handbook that audio devices that
receive interference are improperly functioning as radio receivers. I would
put computers into the same catagory.

Source record: 290153

since you don't say what mode you want to recieve but say your using 2 tone sequencial i will assume that you want either am or fm. someone else stated you could re-align a simple cb handheld or you could check and see if radio shack still sells the "reciever in a chip". it's a single chip that with a few added componets builds a complete receiver for fm. the chip comes with instuctions/plans. also, motorolla has a simular chip. they "as i remember" also have on board squelch in them. or you could always call ramsey. 73's mike ka7hbb

>
>Good advice. Wrong reasons.
>--
Nylon and Dacron (polyester) rope are about the same strength, but Dacron stretches much less than Nylon. Dacron is used on sailboats for halyards and sheets (lines that raise and control sails) where accurate adjusment is required. Nylon is used for mooring and anchor lines, where the stretchability will serve as a shock absorber. (Question after being anchored in a storm - How much force was on my 1/2" anchor line when it measured 3/8" diameter? :-))

To support an antenna between trees, I think nylon would be preferred _because_ it will stretch.

Both nylon and dacron are much less affected by Ultra-violet light than is polypropolene ("hardware store" rope - usually brigh yellow or blue), and are considerably stronger to start with.

1934. Re: Ic24AT to a W2A? (DTMF squelch)

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-09 05:38:03 UTC
From: sknapp@iastate.edu
Message-ID: <1992May9.053803.26829@news.iastate.edu>
Source record: 290156

In article <1992May8.190044.29379@ve6mgs.uucp> you write:
>faunt@cisco.com (Doug Faunt N6TQS 415-688-8269) sez:
>>The one thing that might be useful to you is that the W2A has
>>DTMF squelch, and that is not even an option on the 24.
>Sorry, UT-50/51 works fine for this option ...

SORRY, but the UT-50 is CTSS (PL) encode and decode
UT-51 is CTSS (PL) ENCODE only, no selective squelch here!

The UT-49 (for the SAT) or the standard W2A/2SRA/4SRA has DTMF (touch-tone)
squelch. BIG difference.

1935. Handheld suggestions for beginner

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-09 07:14:26 UTC
From: mrosen@isis.cs.du.edu
Message-ID: <1992May9.071426.4391@mnemosyne.cs.du.edu>
Source record: 290157

I have a novice license obtained when I was a kid in camp back in '84.
I never did put it to use as I got hooked on modems when I was 16.
Now I'm thinking of getting into it and I plan to take the test to
obtain my technician plus (since I already have my novice) to get a
jump on things for the day I can afford a rig.

For now, I'd like to get a handheld transceiver/scanner. I hear that
2-meter is the most popular band, as popular as CB. Then, I believe
there is 440 MHz and 800 MHz... What would you all recommend as far
as which band radio I should get or whether there are good dual band
combinations?

That takes care of the transceiver part of the question. What
handhelds have good scanners that would suit a beginner well? I'd
like something with DTMF encoders and possibly decoders if not too
expensive. I hope to look for something at a hamfest when I have the
money to shell out...

Thanks,
Mike

1936. Digital shaft encoder

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-09 12:03:32 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9205091203.AA16330@ucsd.edu>
Source record: 290158

> Does anyone make a shaft encoder
> whose output is an analog voltage?
>

-That function is performed by a conventional potentiometer.
-For antenna work, use a 5 turn potentiometer to get
-360 degree coverage. Or use a 2 to 1 gear set with a
-270 degree pot.

-You can buy digital potentiometers from Hewlett Packard's
-Opto Division. You would need to connect their digital
-output to a counter and a DAC to get back to an analog voltage,
-but why go to all this trouble when a potentiometer already
-has an analog output.

-Rick N6RK
-rkarlqu@scd.hp.com

Well, it's like this: even the best potentiometers are non-linear.
Shaft encoders _ought_ to be much more linear. Good pots have a
a +/- 0.25% linearity error, so I'll be lucky to get +/- 0.9 degree
precision (360 * 0.0025 = 0.9). Furthermore, a 3- or 5-turn pot,
connected 1:1 to the mast, will lose a lot of resolution. For
example, I want to have the pot "talk" to a 12-bit A/D board. If I
use a 5-turn pot, then best resolution I'll be able to get is
equivalent to (4096 / 5) = 819 = 9.7 bits = +/- 0.44 degree. So, if
my goal is 1/2-degree pointing precision, I can't do it with a 5-turn
pot because the best it can do is +/- (0.9 + 0.44) = +/- 1.34 degree.
When your 1-dB beamwidth is only 2 degrees (or less), this in not
enough precision.

Bottom line : I'd like to find a shaft encoder that delivers
10 bits resolution per/rev with "perfect" linearity. The original
request was for something with an analog output so it could talk to
the A/D board that I already have.

1938. FT 2400H Reply Review

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-09 13:24:25 UTC
From: WRIGHT%morekypr.BITNET@cunyvm.cuny.edu
Message-ID: <9205091324.AA19182@ucsd.edu>
Source record: 290160
Body handling: HTML body converted to readable text

Greetings Fellow Amateurs,

Last week or so I read mr. P.Lucas G6WBJ review of the FT2400 - HT
and posted it to you University Amateur Radio BB. The following is a
reply from another FT 2400 user and what Yaesue has done for him:

From Steven "Buck" Duley KA4DRZ
==========
Date: Tue, 05 May 92 20:42:28 EDT
From: DULESE@morekypr
Subject: Addendum: Yaesu FT2400H PR
To: BB.MARC@morekypr

I would like to add that I own an FT2400H. Both the heatsinking and
memory loss problems have been fixed in the new lots of rigs being
released. I was recently "telephoned" by Yaesu and asked if I would
be willing to part with my rig for a week so that they could make these
new mods to my rig. Impressive! At that point I had never spoken with
any of their reps! Now that's what I call "standing behind your product"!

Also, the new Yaesu FT-530 has been slated for release in late
August. This is a dual-band HT with a serious attitude. From what I
learned when speaking with Yaesu on the phone, this radio has several
features UNIQUE to Yaesu. They had to postpone it's release in order
to activate ALL the patents on the features! If you have the latest
issue of "Radio Fun" you can scope this baby out on the inside back
cover.

73 de KA4DRZ .-.-. ...-.-

>One supplier used to offer a 'standard' and 'heavy duty' power supply, the
>difference being that the 'heavy-duty' one could take 50% duty-cycle....
>they did not state what the 'standard duty' one would manage!

I take exception to this complaint. Radios are designed for the duty cycles they are expected to encounter. This was true with radios that glow in the dark too. The TR4 claimed 400 watts PEP in SSB service, but could only sustain 25 watts in AM service. That was a fire bottle radio. The older radios uniformly quoted their *input* power while modern radios uniformly quote *output* power. This should be kept firmly in mind when comparing radios of yore with modern radios. Since AM consumes 4 times as much PEP power as a SSB signal, a 100 watt SSB radio *should* only produce 25 watts AM to be consistent with it's ratings. There's no "overdrive" involved.

Amateur radios are rated for ICAS service. Only broadcast stations like W1AW need CCS rated radios because *good* operators *listen* more than they talk. 1/2 :-)

A -10 db pilot is only slightly better on average than a controlled carrier AM signal as far as transmitter efficiency is concerned. The high pilot level is confirmation of what I was saying about weak pilots being difficult to acquire.

> The requirement for a PLL to lock is calculated in the loop
> noise bandwidth. This is typically 10 Hz in this kind of system.

> Even when the 4500 Hz channel has 0dB S/N the loop has a 16.5 dB
> S/N.
> This means that the loop stays in lock, even when you can't hear
> the speech.

The narrower the loop bandwidth, the longer it takes to acquire lock. In channelized VHF service, stations can be up to plus/minus 1000 Hz off their assigned channels and still be legal. In such cases, a wider search bandwidth must be used to acquire lock, or a slow sweep must be done with a narrow bandwidth. That's not very acceptable for quick two way exchanges. Remember that ACSSB uses a pilot for AFC to compensate for just such off frequency operation. Staying in lock after lock has been acquired is an easier problem. Note too that FM improvement means that the 12 db out of the noise FM signal will have better than 20 db quieting while the SSB signal will have only 17.2 db

quieting assuming the AFC can keep it precisely centered in an
ideally shaped IF filter. Under normal conditions it won't achieve
that much. Note also that the ACSSB signal offers no suppression
of the types of impulse noise common in mobile environments. Another
big plus for FM.

>>A better system for bandwidth conservation is DSB with synchronous
>>detection. This can offer a 6 db advantage over pure SSB with ordinary
>>product detection and only occupies 6 kHz.
>
> I don't understand how a 6 KHz wide system conserves bandwidth
> better than a 3 KHz wide system ?

It conserves bandwidth over a 15 kHz FM system while *outperforming*
the 3 kHz system in important ways. It offers superior interference
suppression when competing waveforms overlap, it offers easy squaring
loop based synchronous carrier reinsertion, and the transmitter and
receiver circuitry is simpler.

>>Of course spread spectrum with good correlation gain is even better.
>
> ... but doesn't it have even more bandwidth ?

That's not a problem since many signals can share the *same* overlapping
bandwidth as long as their spreading sequences are different. What counts
is the number of communications links per Mhz of spectrum, not the width of
any particular signal. Under heavy loading, spread spectrum degrades
gracefully while narrow band systems begin to generate serious conflicts.

>will key the Icomm (32AT) fine, but won't make the FT470 transmit.

Icom radios will key with higher resistance "leaky mics" than Yaesus.
The easy cure is to change the resistor to a lower value. Both systems
introduce a DC leakage path to ground in the audio lead to generate PTT.
This leakage is several times the nominal 600 ohm audio impedance. In
the Icom 10k will activate PTT while Yaesu specifies 2.2k. Most Icom
mics are around 4.7k and usually work ok with the Yaesu. In cases where
they don't, paralleling another 4.7k resistor across the one in the
Icom mike will make it work.

>
>I would really like to know more about these antennas.

The purpose of the coax on the G5RV is to act as a transmission line transformer to match the impedance at the end of the ribbon line to something close to 50 ohms at the transmitter end of the coax. This antenna is not resonant on any ham band, but the combination of feedpoint impedance, ribbon line transformation, and coax transformation gives a reasonable impedance at the transmitter. Note that there isn't a real balun in the system and you get currents on the shield of the coax.

If your antenna tuner were a true balanced line tuner with split coils and differential capacitors, it would work better than this compromise system. Most tuners only give a passing nod to balanced lines by including a toriodal balun at their output. This works ok if the antenna is near resonance, but the Zepp isn't usually a resonant antenna either. Hence you get RF in the shack. A counterpoise ground can suppress this, but a proper

tuner and proper routing of the feeder would make that unnecessary. Good Zepp/tuner combinations will beat the G5RV, but the G5RV isn't a *bad* antenna for those not able to engineer a better solution, particularly at modest power levels. I often use one myself for portable operations.

>from a 150KV transmittion line, and, while It gives me no trouble on
>the Ham freqs, will I get cancer from the fields?

That's a hard question to answer with confidence. Some studies have
shown biological effects, both good and bad, from exposure to low
levels of low frequency radiation. Bones heal faster when exposed
to low levels of low frequency radiation. But also some cells have
shown changes in internal structure when dividing in the presence
of low level, low frequency radiation. Higher field strengths don't
seem to produce any effects according to a study commissioned by the
IBEW for their members in the power industry.

My guess is that the effect of living near the power line would be
less than the effect of the weed control chemicals sprayed by the
power company along the right of way. Prudence would suggest, however,
that pregnant women shouldn't sleep under electric blankets until more
is known.

RTTY DX Notes 17 April
RTTY DX notes for week ending 17 April, 1992 (BID RTDX0417)

This weekend is the 2nd SARTG AMTOR DX contest. We expect lots of
AMTOR on the bands and we wish everyone lots contacts. Don't forget
to call in FEC and pass your message on ARQ. Bands 3.5, 7, 14, 21 and
28 MHz. Time 0000-0800 UTC, 18th April, 1600-2400 UTC 18th April, and
0800-1600 UTC 19th April. Exchange RST, Name and QSO number.

Our thanks this week go to I5ICY, I5IGQ, TG9VT, VK2SG, VK2EG, W2JGR
and the Twin Cities DX Packet Cluster network, WB2CJL, N5PSI, UT5RP,
DJ3IW and the DB0SPC Central Europe DX Packet Cluster. Thank you all
for your assistance in putting these notes together.

Notes of interest:

Bangladesh (S2). With great surprise S2/HA5BUS showed up on RTTY doing a marvelous job on the air. The operator Imi (HA5HO) is transmitting from Dhaka and states they will be active till April 21 or 22nd. We all hope the DXAC Desk will accept this operation as done earlier for EP/HA5BUS . QSL goes to GLOBEX Foundation, Box 49, 1131 Budapest, Hungary. Their next stop will be Malaysia.

N5PSI, Mike, informs us that he became the QSL manager for 5N3ZIP. Prior to this, the Nigeria station didn't have a QSL route or QSL's. Mike will attempt to get past logs for contacts prior to April 92'. N5PSI is good in 91' and 92 callbooks. Pse QSL direct only.

ST. Kitts (V44). A Japanese group plans to be active from this Island from April 29th til May 3rd on CW, SSB and RTTY.

>From Friday April 24th Syd, (VK2SG) will take back the notes. Many people, TG9VT among others, will be in Dayton and for that he cannot distribute as normal the notes. So those interested must pick it up themselves from TG9VT APlink. VK2SG will see that it is in TG9VT box. Be welcome and the next week everything be normalized.

Thank you all for the help during Syd's absence and let me end by wishing the readers, Happy Easter.

GL DE (DX2) I5FLN at TG9VT.GTM.NA

>know about...

If your plant followed good engineering practice, the most likely cause of
the headaches was blower noise. In our TV plant, a metal building, we have
to use an outside antenna to receive our *own* signal. OSHA standards for
broadcast plant leakage are quite strict. In doing compliance measurements
on our plant, I only found one place with measurable leakage, still way
below OSHA limits, at the aural/visual combiner. That was caused by a worn
join gasket in the rigid line.

>Second is shielding the audio and telephone gear (and other electronic stuff)
>from picking up their transmissions. We have some pretty sophisticated audio
>gear, with more coming, and a video studio in the near future.

This is a real problem with the AM signal. It's going to pervade your site
with fairly strong voltages. The sensitive audio equipment is a prime target.
When video comes in, you're going to have problems with the FM signal as
well getting into tape machines and camera pickups. We had a problem in
our studio where we were getting perfectly satisfactory pictures from a
competitor's transmitter, five miles away, on the blue tube pickups of our
cameras. It took some series resonant traps to get rid of it.

>Are there reference works that I can go look at for guidelines? What are the
>general and commonly accepted practices for this type of activity? I would
>also be interested in hearing about people's experiences, especially gotchas to
>be careful of.

The League's interference book is a good start. The techniques used to
keep ham signals out of consumer equipment also work on professional
equipment. Your most pressing problem is likely to be keeping the AM
signal from rectifying in the microphone amplifiers of your console.
This can be difficult to solve because indiscriminate use of bypass
capacitors will ruin the frequency response you paid so much to
acheive. Common mode chokes and carefully selected bypass capacitors
are required. Usage of high impedance microphones is simply out of
the question.

]My previous post asking for pointers to good introductory DSP
]material has inundated me with 2 replies - one from somebody
]who asked that I publicized whatever I find out, and the other
]trying to sell me on a PC Soundblaster card as a DSP engine.

I can't recommend a good introductory text, but can comment that all
require an electrical engineer's worth of math. However, whatever you
do, go out and buy "PC-DSP" by Oktay Alkin (Prentice Hall). It comes
with a floppy that has a nice DSP workbench that runs on a PC. The workbench
is good for trying out a concept after you have read it. It costs only
$22.00 and is sold at technical book stores. This is an incredible
deal!

For DSP programming in C, you can get "Signal Processing in C" by Christopher
Reid. (Wiley) It is more mathematical, but has a lot of DSP C code. For an extra
$64.00 you can get a complete source library and a DSP workbench. I have
got the source code, but the workbench disk was unreadable so I can't
give a review of it (a new disk is in the mail according to Chris).

From: bartb@hpfcmgw.FC.HP.COM
Message-ID: <19530038@hpfcmgw.FC.HP.COM>
Source record: 290170

Marine VHF frequencies range from 156.025 to 162.000 MHz. Some channels
are ship to ship,others ship to shore and some are assigned for specific types
of operation. It's probably easier to remember channel assignments instead
of specific frequencies; some channels Xmit on one, Rcv on other freqs.

1950. Re: Yeasu FT-470 Mods...

There was a list of strap changes that alter the frequency
limits. As you will notice all the mods that open up 440 on a
reasonable basis for receive, nuke 440-450 transmit which is
kind of important...

R71 R70 R72 Rx and TX Receive only
|0 0 0 430 to 440 Mhz 430 to 500 Mhz
|0 0 1 430 to 450 Mhz
|0 1 0 430 to 440 Mhz
|0 1 1 432 to 438 Mhz
|1 0 0 430 to 440 Mhz
|1 0 1 220 to 225 Mhz
|1 1 0 430 to 440 Mhz
|1 1 1 210 to 235 Mhz

> DISCLAIMER -> I AM aware that tx outside ham bands is illegal, I just like to
> dabble/play with new mods, just for the heck of it. As for the 463.525 freq,
> I would already be authorized for that before I'd use it...Also, the 2m mods
> could be useful in the future for future jobs, like EMT....

It would still be illegal. The FT470 is not type accepted for use in
those frequencies. It makes no difference if you are "authorized" to
use those frequencies or not. Use of non-type accepted equipment
ouside the amateur bands is and had been the basis for certifiate
action and monetary forfieture (of course all the ones I know have
been for people who were doing obnoxious things like operating 100
Watts in the CB bands and conducting broadcast operations using ham
equipment out of band).

/\

SATELLITE PROTON EVENT ALERT

ISSUED: 16:30 UT, 09 MAY

/\

ATTENTION:

Protons at greater than 10 MeV passed the event threshold of 10 pfu at
10:05 UT on 09 May. Protons are still increasing but appear to be gradually
leveling off now near 48 pfu at 16:30 UT.

Protons have produced sufficient polar ionospheric absorption (PCA) to
significantly degrade polar and some high latitude path HF signals. PCA
levels are currently running near 2.0 dB and have stabilized at that level.
A weak PCA event officially began at 14:05 UT.

Protons and PCA are expected to remain above the event thresholds for
approximately the next 12 to 18 hours. They should begin decaying following
the shock from yesterdays M7.4/4B tenflare, which is expected sometime during
the early to mid part of the UT day of 10 May.

A fairly strong sudden magnetic impulse of near 50 gammas was observed
near 16:00 UT. This is the anticipated arrival of the shock from the
long-duration hyder flare which occurred on 07 May. Minor to possible major
storming is expected to redevelop over the next 12 hours. Then, yet another
potentially stronger enhancement in geomagnetic activity is anticipated
following the arrival of the M7.4/4B flare shock on 10 May. That enhancement
could push geomagnetic activity above the major storm threshold. We are
continuing to call for A-indices of near 48 for 10 May. Values in excess of
50 (major storm) will be possible.

** End of Alert **

1952. rec.ham-radio

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-09 18:30:44 UTC
From: phillipsa@skyfox.usask.ca
Message-ID: <9MAY92.18304447@skyfox.usask.ca>
Source record: 290173

Quickie...
Can anyone tell me where I can find current VERY ACCURATE earth-orbit
satellite elements., for most (if not all) of the known satellites ?
Does this information periodically turn up on rec.ham-radio???

thanks... andre...

1953. Re: Can I build a 2m radio on a "Protoboard" and expect it to work OK?

>
>> Will it work OK or will the strips of wire in the "Protoboard" tend to
>> radiate, possibly making it fail?
>

It will very likely not work, i.e. not good enough to pass FCC.
If you build something on 2 meter, take a piece of un-etched PCB
(full copper on the surface) and use the copper for everything that goes
to ground. This way, you'll have a ground surface, thus very short
leads to ground, and no unintended feedback via GND.

Feed each stage with a resisitor of 33 ohms and a decoupling cap of
10 nF (ceramic!), use proper shielding and it will very likely work.

If you want I can send you a copy of an article in RadComm on this, which
was published last year or so. Please include your surface mail address.

Sorry, UT-50/51 works fine for this option ...

Ciao, 73 de VE6MGS/Mark -sk-

Sorry, the UT-50 is *CTCSS* encode/decode and the UT-51 is encode only. Doug was talking about the DTMF squelch as well as paging features in the W2.

Some of the early 'S' series had some kind of DTMF options but I never heard if they were compatible with the '24.

1955. WARNING UPDATE: LOW/MIDDLE LATITUDE AURORAL ACTIVITY

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-09 22:42:57 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.705451377@honte>
Source record: 290176
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

UPDATED: 22:30 UT, 09 MAY

/\

UPDATE

HIGH RISK PERIOD: 10 - 11 May (UT days)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >45 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW - MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: GOOD - FAIR

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

SOUTHERN OREGON TO NORTHERN NEVADA TO UTAH TO COLORADO TO KANSAS AND
POSSIBLY PARTS OF NORTHERN OKLAHOMA TO MISSOURI AND POSSIBLY PARTS OF
NORTHERN ARKANSAS TO KENTUCKY AND POSSIBLY AREAS OF TENNESSEE TO
NORTH CAROLINA. SPORADIC BURSTS OF ACTIVITY MAY BECOME VISIBLE OVER
PARTS OF CALIFORNIA, NORTHERN ARIZONA, NORTHERN NEW MEXICO NORTHERN
TEXAS, MISSISSIPPI, ALABAMA AND GEORGIA.

SYNOPSIS...

A strong interplanetary shock arrived at 19:59 UT on 09 May. The
impact of this shock has produced anomalies and guidance problems on some
geosynchronous spacecraft. Some of the sensors on-board GOES-7 have been
affected over the last 3 or 4 hours. This is noted since GOES-7 is also an
important bird for weather satellite imagery and may have been affected in
other ways aside from the solar monitoring equipment which is known to be
affected.

Auroral activity has increased substantially following the arrival of
the interplanetary shock. Conditions are expected to be highly favorable for
strong middle latitude auroral activity during the early UT day of 10 May
(the local evening and early morning hours of 09/10 May over North America).

We are closely monitoring conditions to determine whether a warning for
low latitude activity may be necessary. At the present time, the Low
Latitude Auroral Activity WATCH remains in effect. However, this could
change rapidly if the main phase is as energetic as it appears it might be.

A Low Latitude Auroral Activity WARNING may be issued over the next six hours.

** End of Warning **

1956. Propagation Forecast Bulletin 19 ARLP019

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 02:45:30 UTC

ZCZC AP27
QST de W1AW
Propagation Forecast Bulletin 19 ARLP019
>From Tad Cook, KT7H, Seattle, WA
May 9, 1992
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP019
ARLP019 Propagation de KT7H

The sunspot cycle hit another low this week. On May 3 the
solar flux dropped to 125.6, the lowest since nearly two
years earlier on May 4, 1990. The only disturbed day was
May 2 when a minor flare drove the Boulder K index briefly
to 5. Otherwise propagation was fair through the week.

At this stage of the cycle numerous small simple sunspot
groups appear briefly, only to fade away. It is clear
that we are seeing a drop in activity as the solar cycle
heads toward the next cycle minimum. Solar indices will
decline over the next few years as we fade from the cycle
maximum in July, 1989. We can still expect brief periods
of intense activity, particularly from recurring coronal
holes on the solar surface.

The solar minimum for the month should occur around now,
and the solar flux should climb again toward a peak near
180 around May 16. Another minimum should follow around
the end of the month. A slight increase in geomagnetic
activity is possible around the 15th to the 18th of May.
Some forecast models suggest a temporary increase in
solar activity from late May until July.

Sunspot Numbers from May 1 through 7 were 114, 109, 107,
136, 128, 135 and 135, with a mean of 123.4. 10.7 cm
solar flux for the same period was 130.9, 135.8, 125.6,
134.7, 133.0, 130.6 and 129.1, with a mean of 131.4.

Thanks for the clarification, and I owe you an apology, I did not
see the original article in it's entirety. I have been active
in several projects here, mostly to support public service aspects
of the hobby. Also have been actively involved in trying to
improve the capability of those using packet in this area. I have
not done much in the hardware development arena, I have been known
to help others with debugging problems with equipment and repair.

>I seem to have started something here which has grown beyond what I
>intended. What I was originaly trying to say was that no one should
>post a commercial for a product unsolicited. I also went on to
>describe the DSP-12. AT NO TIME did I run down the WORK of N4HY or
>the DESIGN of the AEA DSP2232 both of which are excellent.

I am glad that you have elaborated on this, and for my flame I truly
ask your forgiveness.

I would appreciate it if you would elaborate on your current projects
I have several repeators that I am currently attempting to keep on the
air, both digital, and otherwise. I installed a multi port packet switch
earlier this year, and have been looking for others that might be interested
in increasing the speed and connectivity of the site. At present
It has 2 ports, one 1200 baud (2 meter) and 9600 baud (440).

Just thought I would pass it along....

1959. ALERT: Minor Geomagnetic Storm Alert

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 06:51:22 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.705480682@honte>
Source record: 290080
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

MINOR GEOMAGNETIC STORM ALERT

ISSUED: 06:30 UT, 10 MAY

/\

ATTENTION:

Geomagnetic activity has surpassed the minor storm threshold at 06:00
UT. The storm start-time will be set back to 19:55 UT on 09 May to coincide
with the influential SSC that was observed then.

Minor to major geomagnetic storming will continue over the next 24 to 48
hours. Major storming is currently being observed over the North American
regions (during the local night sector). Similar minor to major storm
conditions can be anticipated over all regions during the local evening and
early morning hours.

Protons are continuing to slowly fall back from the large maximum of
4,200 pfu that was observed at 20:35 UT on 09 May. A secondary maximum is
anticipated shortly before the arrival of the shock generated by the major
M7.4/4B tenflare of 08 May. This second shock is expected to arrive near
15:00 UT on 10 May and could enhance levels of geomagnetic activity or
sustain them at the present minor to major storm levels. There is a risk
this disturbance could surpass the major storm threshold over the next 24
hours.

Polar and high latitude path HF signal propagation remains useless.
PCA remains high and is producing radio-blackout conditions over these paths.
Blackout conditions are expected to continue over the next 24 hours. Some
improvement can be expected on 11 May, with more substantial improvements on
12 May. Middle latitude regions are experiencing poor to very poor
propagation conditions during the local night sectors. Low latitudes are
observing generally fair conditions. No significant changes are expected in
these conditions for the middle and low latitudes over the next 24 hours.
Some improvements are anticipated for late on 11 May and on 12 May.

** End of Alert **

1960. Re: Yaesu FT-470

> seem to nail its designation down.

The one I use is the NC-42, but it requires a little bit of whittling
to fit the 470 batteries. It's intended for the new micro-HT batteries.
Yaesu came out with yet another charger for 470 batteries recently. I
saw it at Dayton. It's the NC-37. It's *supposed* to use the same pulse
charging method as the NC-42, but I haven't tried it. The NC-29 timed
charger *will* definitely fry your batteries, avoid it. I can only
recomend the NC-42 since I haven't tried the NC-37. I *know* the NC-42
won't fry your batteries and it's smaller and lighter than either of
the other two. Nice for carrying around in the briefcase for hotel
room recharges. You have to thin, or remove, the guide ridge on the
side of the charger pocket for the 470 batteries to fit. A Dremel
tool makes a neat job, but a pocket knife will suffice.

>glow in the dark too. The TR4 claimed 400 watts PEP in SSB service, but
>could only sustain 25 watts in AM service. That was a fire bottle radio.

True... I think a better example is made with plate modulated
firebottle rigs. Johnson Ranger/Viking/Valiant and the like. All had AM output
in the 50-175 watt range.

>The older radios uniformly quoted their *input* power while modern radios
>uniformly quote *output* power. This should be kept firmly in mind when
>comparing radios of yore with modern radios. Since AM consumes 4 times
>as much PEP power as a SSB signal, a 100 watt SSB radio *should* only
>produce 25 watts AM to be consistent with it's ratings. There's no
>"overdrive" involved.
>
Input vs output ratings were not an attempt at deception, but probably
to meet the conventional legal measurement methods defined by the FCC at
the time. The Peak power vs avg is a good one to keep in mind. Most
tuners nowadays are rated at peak power (and even then, optimistically
IMHO!). A "250 watt" modern tuner will use receiver plate-spacing variables
and #16 interconnect wire. A 250 watt Johnson matchbox uses silver plated
swithces, 3/16" plate spaceing etc. 4x250=1kw so these boxes are probably
good for a gallon of SSB.

>Amateur radios are rated for ICAS service. Only broadcast stations like
>W1AW need CCS rated radios because *good* operators *listen* more than
>they talk. 1/2 :-)
>

With only minor derating, many of the older radios were usable for CCS service.... No argument about the good operator statement Gary!!

Now comes the opinion part... modern rigs are about as exciting to use as a telephone is. One plugs it in, turns it on and talks. Older gear requires some care and feeding to get (and keep!) running, along with more understanding of the "innards". THere is no argument that watching the flicker of a pair of 807s in modulator service is much cooler than observing a LED bar meter. :-) Old gear is a blast to operate.

See you in the AM window!

>MROWEN@STLAWU

Why do you need this kind of resolution? If you have a new kind of beam
that has a 1/2 degree beam width or a 1 degree beam width, I would sure like
to know about it... Any beam that I know about has a FAR wider beam width

than this.

>It can be done, but the cost is quite high. The purpose of a lightning
>arrestor is to prevent equipment damage from NEARBY strikes.

Indeed, as the cobbler's son, I suffered over $10,000 worth of damage due to lightning even though professionally I know that lightning is no different than any other electrical discharge and that there are proven ways of dealing with it. Lightning behavior is somewhat *different* than the behavior of a 12 volt battery, but the current flows are just as predictable and just as manageable. Some of the techniques are different due to the magnitude of the voltages and currents and due to the pulse nature of lightning. You have to treat lightning discharge paths as if they were UHF paths.

The broadcast plant I'm responsible for gets struck *directly* in *every* storm, yet sustains no damage. 1000 foot towers make dandy lightning targets. The techniques for complete lightning protection are well known in the broadcast business. Since I did a *professional* job on my home station, my home tower has been struck repeatedly with only an Isopole turned to confetti and some melted 9913. No damage to radios or anything else in the house.

Lessons learned: Isopoles aren't heavy enough conductors to sustain direct strikes. Don't put them at the top of tall towers. Heavy copper pipe J-poles are better. A *good* ground field is mandatory. An 8 foot rod won't cut it. I use 8 ground rods connected by buried 5 inch copper strap distributed over 1200 square feet. More surface in contact with the Earth is more important than depth of contact. Bond each tower section *electrically* as well as mechanically. Route cables *inside* the tower structure. Use high quality gas discharge arrestors on all cables *directly* at the base of the tower which should be the single point connection for all grounds in your system. Ground loops are more likely to destroy equipment than any other single installation mistake.

All ground runs must be direct with *no* sharp bends. Lightning behaves like UHF RF and a 90 degree bend in a ground wire appears as a large inductance to the bolt. You want to direct the current straight down your tower and into the ground field. You don't want it making any detours through your equipment. The third wire safety ground on line powered equipment can be a problem. You should isolate it with a heavy choke. This allows it to still operate as a safety ground, but keeps

it from looking inviting to lightning. I lost a computer system by ignoring this rule.

Gas discharge arrestors that protect against common mode as well as differential mode potentials are a must. Lightning Protection Assoc makes suitable units for coax, rotator cables, and phone lines. A certain heavily advertised arrestor does *not* protect against common mode voltages. Beware of lightning arrestors in black housings that don't provide a *heavy* ground lug for the *outer* conductor of the coax.

Main entrance line power protection requires a heavy arrestor. I use the LA 302-R from Delta Lightning Arrestors of Big Spring Texas on my entrance panel. This arrestor can safely handle 60,000 amps and fires at 380 volts. On really big strikes these arrestors react explosively. Care must be taken in selecting their mounting position.

Your basic varistor surge suppressors are useless for lightning suppression, but can be useful for handling spikes induced by nearby strikes. I use Panamax suppressors on all sensitive equipment. If you can supply power though a continous UPS, or even a constant voltage transformer, that is even better protection against spikes. Be wary of common safety grounds on these devices. That can undo the protection they offer.

Lightning need not be a mythic beast that devours all in it's sight, but it is dangerous and very careful steps are required to tame it. One mistake in installation can undo thousands of dollars worth of suppression equipment. You must consider every possible path during installation. At multi-thousand amp flows, ground isn't an equal potential resource. Ground loops *will* appear and destroy equipment if you use any technique other than absolute single point grounding.

1964. Need manual on 931MHz Motorola Pager

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 15:19:20 UTC
From: kessler@cbnewsk.cb.att.com
Message-ID: <1992May10.151920.29453@cbnewsk.cb.att.com>
Source record: 290085

I need a service manual for a 12 digit pager.

I believe it is a Motorola Bravo set for 931.1625MHz operation.
(Model AD5JRB ???).

I picked it up at the Dayton Hamvention and I hope to find tune-up and
address programming information.

How far can the frequency be moved?
Does the pager use the POCSAG or GSC protocol?

Any pointers to useful information would be appreciated.

RACESBUL.221 DATE: May 11, 1992
CATEGORY: MGT
SUBJECT: FEMA funds "short fuse"

Federal matching funds sometimes have a very "short fuse" time interval in which to act. This is where FEMA may ask if you are prepared to share in some surplus funds that will run out quickly. But if, through proper planning, your Radio Officer has a shopping list of necessities ready to fit the matching funds, your jurisdiction may be able to secure funds during the "short fuse" time period. Understandably, this can be a frustrating factor, not knowing if and when and how much Federal matching funds may be available for RACES equipment from year to year. Jurisdiction budget cycles vary, as do the techniques within jurisdictions. Some can take eighteen months, others can move quickly within days. Nevertheless, "short fuse" FEMA fund opportunities do occur, and can be utilized to help with budgetary problems with adequate planning. Which is a very good opportunity to include your Radio Officer.
Don't short change the ingenuity of your Radio Officer when it comes to the budgetary process. Besides FEMA matching funds, the Radio Officer can sometimes attract local business contributions, filtered through appropriate means, such as a local service organization. In times of short budget funding, look for the unusual opportunities and be prepared to take advantage of those that are suitable to your jurisdiction. ---Stan Harter, KH6GBX

1966. The high cost of heat

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 15:47:37 UTC
From: wb9rsq@wb9rsq.ampr.ORG
Message-ID: <26193.wb9rsq@wb9rsq.ampr.org>
Source record: 290087

The adds say that one of these new dc motor type furnaces will help save money and heat your house more evenly. Well, we put one in. The Bryant 398B.
It does everything the add claimed, it is quiet, more energy efficient, and the heat and cooling is nice and even. So what, I here you say. The cost I am referring to is the noise on the vhf band.
I first thought it was one of my many electronic devices, so I went on a shut down spree. I killed everything I could think of with a micro processor.

The noise continued. Finally I shut off the blower for the furnace. Yep, that did it. I forgot that the dc motor speed is controlled by a micro processor.
The noise level created by the 398B is so high that the entire 2m band has hash and rfi on almost every frequency. It sounds like a pulsing carrier with the usual computer noise thrown in for extra listening pleasure. Signal strength is often a solid s9+.
I am now in the process of building a new home, and I had planed on getting on of these nice dc type furnaces, but now I think I will stick to a furnace with a normal motor, unless someone out there has a way to wipe the noise created by this fine piece of modern climate controlling technology.

Keywords:

In article <9205081219.AA25820@ucsd.edu> FLEM%athena@leia.polaroid.COM writes:
]A few years ago someone tried to build a 25 Mhz 250mw LASER driver using
]a protoboard. It was a mushy mess. Difficult to drive. Cross coupling
]nightmare. All our prototyping now gets done on D.S. Cu Vector board with
]the ground plane removed from under rf conductors (to reduce capacitance).
] Find a circuit board. It will be fairly easy to play with the
]'spokes' since the wheel has already been invented.

A good technique for prototyping RF (and one the pro's use) is to take
a piece of double sided PC stock. On one side, cut the copper into
quarter inch squares (you can use a hacksaw or a dremel tool, or you can
etch it). Solder the components to the squares, keeping leads short. Where
you need a ground, drill though and solder a jumper. If there is a node
that shouldn't have any significant capacitance to ground, remove the
copper on the reverse side under that pad.

Message-ID: <57221@hydra.gatech.EDU>
Source record: 290088

Ok everyone, sit back because I have a little story to tell.
Back during spring break of this year I took off from school and went
home to work with my dad for the week (yes I could have gone to the beach
but instead of spending money I made some money. All the more to spend on
radio stuff!). So naturally my IC24at came with me. There are a few repeaters
back home that I can pick up, and I mean a few. Well, anyway, when I went to
work I found out that they were building on a new building to the rest of the
operation. The guy that was in charge of the construction crew had a 24at
just like mine and I said "Hey, thats pretty cool. I didn't know Icom made
a commercial 24at." And the guy said "Yea, the boss bought a couple of these
from the Icom (commercial) dealer and they are pretty nice." And the guy that
was in charge of the maintainence people there said "Yea the same company quotedus some of
those 24at's but we decided to go with Motorola."
Well everything was just fine until the end of the week when my 24at went
crazy. So when I got back here in Atlanta, I took it down to the Icom service
center just a few minutes away (which really makes things nice). While they
were fixing my radio I mentioned that the week before I had seen for the first
time a commercial 24at and how I didn't even know one existed. And they said,
"Icom doesn't make a COMMERCIAL 24at." So my first question:

1) Can this commerial radio supplier get in real big trouble for selling
amateur radios, not type accepted, as commercial radios?

and secondly,

2) How would I go about doing something about it? Or is it none of my
business?

Thanks in advance for anyone's input.

1970. ALERT: STORM UPGRADED TO MAJOR GEOMAGNETIC STORM

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 18:34:29 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.705522869@honte>
Source record: 290090
Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

MAJOR GEOMAGNETIC STORM ALERT

ISSUED: 18:00 UT, 10 MAY

/\

ATTENTION:

Geomagnetic activity surpassed the major storm threshold at 12:00 UT on 10 May. Very severe geomagnetic storming has been observed during the local night sector over North American middle latitude regions. High and polar latitude regions have experienced major to severe storming. Peak K-indices for Boulder reached 8 (equivalent A-index of 240) between 09:00 UT and 12:00 UT. Conditions seem to be stabilizing somewhat now that we are passing the morning sector. The estimated running 24 hour A-index for Boulder, Colorado is now near 91. Estimated running 24 hour planetary A-index is 64. Total field values at Boulder dropped significantly to below 54,830 gammas (very low) at 10:00 UT. There is a chance geomagnetic activity may surpass the severe storm threshold of 100 over the next 12 to 18 hours.

Conditions are expected to range from minor to severe storm levels with sustained A-indices above or near the major storm threshold over the next 24 hours. There is a chance A-indices may even surpass the severe storm threshold of 100 over the next 24 hours, although this remains to be seen. A shock from the M7.4/4B tenflare has not yet clearly manifested itself, but is expected any time now. After it arrives, conditions are expected to remain at major to possibly occasionally severe storm levels for approximately 12 hours.

A Low Latitude Auroral Activity WARNING has been issued. Conditions during the local evening and early morning hours of 09/10 May were very favorable for middle latitude observations of auroral activity as well as low latitude observations. Numerous low latitude regions have reported auroral activity. These conditions are expected to persist over the next 12 to 18 hours, but will depend on the strength of the anticipated M7.4/4B flare shock which is due to arrive any time now.

Protons remain well above the event threshold near 35-45 pfu. Protons stabilized near this flux level at 12:00 UT. They may increase slightly again prior to the shock arrival from the M7 flare, before finally falling below the event threshold of 10 pfu later today or early in the UT day of 11 May.

HF propagation conditions have been extremely poor over the middle, high, and polar latitude regions. Low latitudes have observed mostly very poor to fair propagation conditions. Polar to high latitude signal paths have observed near continual radio-blackout conditions. Middle latitudes witnessed frequent blackout periods during the local evening and early morning hours during the severe to very severe geomagnetic storming. The weak state of the ionosphere will permit generally only north-south propagation over the low and middle latitude regions. Signals attempting to pass over the central to northerly middle latitude regions on east-west paths will be heavily attenuated and disturbed. Essentially dead propagation will exist on the high and polar latitude signal paths until things start settling down later on 11 May and on 12 May.

Numerous reports of VHF auroral backscatter have been received. Conditions were very favorable for low and middle latitude auroral backscatter. High latitude regions have not been as favorable. Additional backscatter can be expected over the next 24 hours during strong geomagnetic storm periods. However, signal stabilities will be poor with rapid fading and even "motoring" of VHF signals.

** End of Alert **

1971. WARNING: LOW LATITUDE AURORAL ACTIVITY WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 18:42:06 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.705523326@honte>
Source record: 290091
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

ISSUED: 18:00 UT, 10 MAY

/\

HIGH RISK PERIOD: 10 - 11 May (UT days)

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >42 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW - MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: GOOD - FAIR

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

CENTRAL CALIFORNIA TO NORTHERN NEVADA TO NORTHERN ARIZONA TO NORTHERN
NEW MEXICO TO NORTHERN TEXAS TO OKLAHOMA TO ARKANSAS TO NORTHERN
MISSISSIPPI TO NORTHERN ALABAMA TO NORTHERN GEORGIA TO SOUTH
CAROLINA.

SYNOPSIS...

Conditions became favorable for low latitude auroral activity
observations during the local evening/early morning hours of 09/10 May over
North America. Numerous reports of low latitude observations have been
received. The disturbance which spawned this major auroral storm is still in
progress, but is showing some signs of gradual weakening. However, another
disturbance from a recent major class M7.4/4B solar flare is expected to
arrive anytime now and may further enhance auroral activity to strong storm
levels for 12 to possibly 18 hours following the shock arrival. Therefore,
auroral activity may very well remain visible over the lower latitudes during
the local evening and early morning hours of 10/11 May over North America.

To observe the auroral activity, a dark sky site is required away from
city lights and other light pollution. The phase of the moon will inhibit
attempts to view activity, particularly over the lower latitudes. However,
the luminosity of the auroral activity, particularly over the middle latitude
regions will override much of the lunar interference.

Please note that there is a slight chance the disturbance from the M7
flare might not arrive or may be less energetic than first anticipated. If
this is true, conditions may steadily weaken over the next 12 hours,
degrading the potential for low latitude observations of activity.

As of 18:00 UT, Kansas City, Missouri appears to be the lowest latitude
that has observed auroral activity over the last 24 hours.

** End of Warning **

1972. Space Shuttle Rebroadcast Freq. VHF/UHF

Newsgroup: rec.radio.amateur.misc

north New Jersey/NYC area on either 2 meters or 70 cm? Thanks in advance.

1973. Inquiry: Standard C628 1.2GHz Dual HT

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-10 19:44:58 UTC
From: crawford@ENUXHB.EAS.ASU.EDU
Message-ID: <9205101944.AA09334@enuxhb.eas.asu.edu>
Source record: 290093

Standard Communications introduced their new 1.2 GHz HT at Dayton (so I'm told). Yet, they haven't released the spec sheet on it. A phone call to Standard reveals that the output on 1.2 GHz is (as one would expect from the market of 1.2GHz equipment) is 1 Watt. The max output on 450 MHz is 5 watt w/ the 12 volt battery and 3.5W w/ the 7.2 volt battery.

Does anyone here own one of these things? Of interest: How does the front end compare to other Standard HT's (i.e. selectivity, sensitivity, inter-mod, etc)? HRO Sunnyvale has the only one in stock at the moment. I'd buy it if I knew it will match the performance of their other dual-banders.

Comments appreciated.

I bought a nifty weather balloon radio sonde at Dayton this year.
It's made by a company called VIZ. It is complete with sensors
for temp and humidity. Does anyone know what frequency this beast
is on? It appears to be around 400 MHz from what I can observe of
the RF section.

How many launch sites for these balloons exist in the US?

Anyone had experience with this stuff?

thanks,
c.t.

This information was copied from an article posted in rec.ham.radio in August 1991. This article may not answer many of the questions that were asked by the original poster, however, it may be useful to some of you on usenet. The author of this information is unknown. I saved this information because I have a BRAVO pager and found these tidbits of information useful.

~jack_

.....Begin recorded message.....

IF YOU HAVE A MOTOROLA BRAVO PAGER THIS WILL HELP YOU WITH SOME OF THE FEATURES OF THIS UNIT YOU MY NOT KNOW ABOUT.

SELF TEST:
TO PUT UNIT INTO A SELF TEST TURN OFF PAGER. NOW HOLD DOWN THE GRAY ARROW KEY AND BLACK LOCK KEY AT THE SAME TIME AND TURN ON PAGER. THIS TELLS THE CPU IN PAGER TO GO INTO A SELF TEST. YOU WILL GET A 2 SECOND LONG BEEP, RELEASE THE GRAY & BLACK BUTTON AND PUSH THE GRAY BUTTON BEFORE THE 2 SECOND BEEP ENDS. IF YOU DID ALL THIS IN TIME YOU WILL HAVE "SPL" OR "PAGING P?" AND NOT THE DOTTED LINE YOU ARE USED TO SEEING WHEN YOU TURN ON PAGER . BY PRESSING THE GRAY KEY IT WILL GO TO A DISPLAY TEST, PRESS AGAIN AND YOU WILL GET THE PAGERS CAPCODE (CAPCODE IS THE UNIQUE SERIAL NUMBER WHICH THE PAGING TRANSMITTERS TRANSMITS TO YOUR PAGER TO TURN ON YOUR PAGER WHEN SOMEONE PAGES YOU). WAIT AND IN ABOUT 3 SECONDS IT WILL DISPLAY YOUR SECOND CAPCODE (IF YOU HAVE ONE-MOST DON'T) PRESS THE

GRAY KEY AGAIN AND IT WILL CHECK CONTROLS, PRESS IT AGAIN AND IT WILL TEST VIBRATOR FUNCTION (IF YOUR PAGER HAS IT). TURN OFF PAGER AND TURN ON AGAIN TO DISABLE SELF TEST.

SPECIAL PROGRAMMED FEATURES:
TAKE OFF BATTERIES CLIP AND IN CENTER TOWARD THE FRONT OF PAGER YOU WILL SEE A PRINTED CIRCUIT BOARD EDGE PINS (JUST LIKE THE BACK SIDE OF A NETENDO CARTAGE. THIS EDGE PINS ARE PLUGGED INTO A CORE PROGRAMMER. THE PROGRAMMER CAN CHANGE.

CAPCODES: SEE ABOVE

AUTORESET TO MANUAL: YOUR PAGER IN AUTORESET WILL BEEP 8 TIMES THEN STOP BEEPING. MANUAL RESET THE BEEPER WILL KEEP BEEPING TILL THE COWS COME HOME OR YOU PUSH A BUTTON TO LOOK AT THE MESSAGE.

DISPLAY: ENGLISH PROMPTS OR INTERNATIONAL-SYMBOL SCREENS DISPLAYED.

SILENT MODE CHIRP: FOR A SINGLE BEEP WHEN YOUR PAGED. NOT FOR USE ON VIBRATOR PAGERS.

BEEP ON BAD DATA: YOUR PAGER HEARS IT'S CAPCODE BUT RECEIVED BAD DISPLAY MESSAGE, IT WILL PUT "EEE" ACROSS DISPLAY TO SHOW BAD RECEIVE. IF THIS IS FEATURE IS NOT ENABLED AND YOU RECEIVE BAD DATA YOUR PAGER WILL NOT BEEP AND YOU WILL HAVE NO IDEA SOMEONE TRYED TO PAGE YOU.

****
NOW LETS SAY YOU ARE UNHAPPY WITH YOUR PAGING COMPANY "A" BUT OWN YOUR PAGER. YOUR $200.00+ PAGER IS TUNED TO THEIR FREQUENCY AND YOU WANT TO GO TO ANOTHER PAGING COMPANY BUT NOT LOSE ALL THE MONEY YOU SPENT FOR YOUR PAGER. THE ANSWER IS TO RECRYSTAL PAGER TO THE NEW FREQUENCY OF COMPANY "B". BUT WE MUST ANSWER SOME QUESTIONS FIRST TO SEE WHAT IT WILL COST.

1. WHAT IS YOUR PAGERS CODING FORMAT (POCSAG) OR (GSC)
THE EASY WAY TO TELL IS TO DO A SELF TEST AND READ CAPCODE. IF IT'S 7 NUMBERS IT'S POCSAG. IF IT'S 6 NUMBERS AND 1 LETTER IT'S GSC. IF YOUR PAGER DOES NOT MATCH THE SAME CODING FORMAT AS COMPANY "B" IT WILL COST MORE THEN IT'S WORTH TO CHANGE.

2. WHAT BAUD RATE IS YOUR PAGER WORKING AT ? DO SELF TEST AND IF DISPLAY SHOWS PAGING P1 PAGER IS WORKING AT 1200 BAUD OTHER WISE YOU ARE SAFE TO ASSUME 512 BAUD IT MUST MATCH COMPANY "B" BAUD RATE TO BE WORTH YOUR TIME.

3. ARE YOU IN THE SAME FREQUENCY BAND 931 MHZ OR 450 MHZ ETC.
IF COMPANY "A" AND COMPANY "B" ARE NOT IN SAME BAND IT WILL TAKE A NEW RECEIVER BOARD TO CONVERT PAGER AND COST TO MUCH TO TRY.

IF ALL THE ANSWERS ABOVE SHOW YOU ARE COMPATIBLE YOU CAN CALL COMPANY "B" AND TELL THEM YOU WANT TO DO BUSINESS WITH THEM AND

NEED A CAPCODE NUMBER SO YOU CAN GET PAGER RECRYSTALED AND HAVE A
CAPCODE PROGRAMMED AT THE SAME TIME.

NOW YOU CAN HAVE COMPANY "B" RECOMMEND A SHOP THAT WILL
RECRYSTAL PAGER OR LOOK UP ONE YOURSELF.

THE LEAST EXPENSIVE I HAVE FOUND IS:

ECONO-COMM
3710 N.W. 16TH ST.
LAUDERHILL, FLA. 33311

305-581-4980
305-581-4985

LAST TIME I CHECKED RECRYSTAL OF PAGER COST $19.00 AND REPAIR COST
OF $16.00 WITH A 30 DAY WARRANTY. BUT PRICES ARE ALWAYS CHANGING SO
CALL FIRST BEFORE YOU SEND ANYTHING, AND MAKE SURE YOU INSURE PAGER
IN SHIPPING.

.........................End of recorded message..........................

From: jdelancy@tecnet1.jcte.jcs.mil
Message-ID: <9205102307.AA16088@tecnet1.jcte.jcs.mil>
Source record: 290097

Sour grapes or not, I dont think that the issue of K3VOA
and how it was issued is "isolated".
Check out W2DDH and WB2DDH in the callsign database or call book.
Makes you wonder, huh?

I did:

Callbook v1.3 Bug reports to bowen@cs.buffalo.edu Type 'help' for help
>> call wb2ddh
No references found
>> call w2ddh
No references found
>>

Hey, that's amazing - neither of the calls is in the database. What's more, neither is in the callbook, which proves it - not just one of them is not in there, they both aren't, the odds against that must be really astronomical. Well, I for one am convinced!

>>Makes you wonder, huh?

I'll say it does!

Not everybody knows this, but WA4CEW's wife's initials are CEW (and they are both "C.W."). You gonna report them or shall I? (actually, he got his call before he was married - can you imagine how tough it was to find someone with the right initials?).

Coincidence? Conspiracy? - you be the judge...

/\

MAJOR GEOMAGNETIC STORM UPDATE

01:00 UT, 11 MAY

/\

ATTENTION:

There is a very real possibility geomagnetic activity may surpass the severe storm threshold. Boulder is reporting an A-index of 99, which is only one point short of a severe storm classification. One more major storm period prior to 06:00 UT will be sufficient to reclassify this storm as a severe event.

Minor to major storming is expected to continue, with severe storm periods a definite possibility during the local evening and early morning hours of 10/11 May.

Significant levels of auroral activity are possible (if not expected) during the night-sectors. North America is expected to experience intense levels of auroral activity, particularly over the middle latitude regions. The Low and Middle Latitude Auroral Activity WARNINGS will remain active throughout the next 12 to 18 hours.

HF propagation conditions remain strongly degraded over all regions. No significant improvements are expected until the mid to late part of 11 May or early 12 May when conditions are expected to begin stabilizing. Until then, all regions will continue to observe heavy degradation of HF signals on all paths and all frequencies. High and polar latitude signal paths (as well as paths passing through the northern to central middle latitude regions) will be particularly heavily affected with high levels of absorption, fading, distortion, and noise.

** End of Alert **

1981. WANTED: Control Head and Cabling for Mitrek

I am presently in need of the control head and cabling to a 4 Channel Low Band Motorola Mitrek mobile radio. I recently aquired the tx/rx section of the radio, but it had no control head or cabling, so it is basically useless to me.

If any

1982. UPDATE: LOW/MIDDLE LATITUDE AURORAL ACTIVITY WARNING

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 01:14:44 UTC
From: oler@rho.uleth.ca
Message-ID: <oler.705546884@honte>
Source record: 290102
Cross-posted to: sci.astro,sci.geo.meteorology,rec.radio.amateur.misc,rec.radio.shortwave

/\

LOW LATITUDE AURORAL ACTIVITY WARNING

UPDATED: 01:00 UT, 11 MAY

/\

* UPDATE *

HIGH RISK PERIOD: 11 May (UT days)
MODERATE RISK PERIOD: 11 - 12 May

POTENTIAL MAGNITUDE OF LOW LATITUDE AURORAL ACTIVITY: MODERATE - HIGH

POTENTIAL EQUATORWARD POSITION OF AURORAL OVAL: >42 North Latitude

POTENTIAL LUNAR INTERFERENCE: LOW - MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM LOW LATITUDES: GOOD - FAIR

AURORAL ACTIVITY _MAY_ BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

CENTRAL CALIFORNIA TO NORTHERN NEVADA TO NORTHERN ARIZONA TO NORTHERN
NEW MEXICO TO NORTHERN TEXAS TO OKLAHOMA TO ARKANSAS TO NORTHERN
MISSISSIPPI TO NORTHERN ALABAMA TO NORTHERN GEORGIA TO SOUTH
CAROLINA.

SYNOPSIS...

Conditions (at 01:00 UT on 11 May) remain strongly favorable for middle
and low latitude observations of auroral activity. Intense levels of auroral
activity have persisted over the last 18 to 24 hours and are expected to
continue for the next 12 hours before beginning to subside somewhat.

North American regions are expected to witness another night of strong
auroral activity during the local evening and early morning hours of 10/11
May. Lunar interference will drown out some of the fainter auroral
structures, although overall opportunities for viewing energetic activity
remain good.

** End of Warning **

Before you go searching in call books and pointing fingers, remmber that rules change. In 1977 or so, ExtraClass licensees could get any call sign they wanted in their area. Thats where AA4RE came from. In the 60's you could spend some money and buy a call from the FCC.

So just because its somebody's initials or whatever, doesn't mean that anything was sneakily done.

Roy, AA4RE

1984. How to ID transmitting tower?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 02:46:57 UTC
From: 3IU6YVN@CMUVM.CSV.CMICH.EDU
Message-ID: <92131.2246573IU6YVN@CMUVM.CSV.CMICH.EDU>
Source record: 290104

I live in a rural area, and there are several transmitting towers nearby. Some are easily identified by the surronding buildings (the campus television station, for example), but most are not so easily identified. Is there an easy way to find out who is using them to broadcast? Is this a matter of public record (if, for example, they are police repeaters, etc.)?

All replies appreciated. Posts preferred, but email is fine.

1985. Suggestions for Antenna Combining?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 02:52:20 UTC
From: seanp@undr.org
Message-ID: <1992May10.497867.o75U9@undr.org>
Source record: 290105
Cross-posted to: rec.radio.shortwave,alt.radio.scanner,rec.radio.amateur.misc

After my recent post inquiring as to suggestions for a good home scanner antenna, I decided that there was no GOOD wideband choice. So, I have decided to go a little better route.

What I will be doing is buying three seperate commercial vertical antennas. One for 30-50, one for 108-174, and one for 450-470. I will feed them all with Belden 9913 coax.

What I would like to know is what the best way to feed them all into my scanner would be. I don't want to have to switch them when I want them, I want all the antennas to combine into a single piece of coax.

Any suggestions would be greatly appreciated.

Cross-posted to: sci.astro,rec.radio.amateur.misc,rec.radio.shortwave

/\

SEVERE GEOMAGNETIC STORM ALERT

UPGRADED: 03:30 UT, 11 MAY

/\

ATTENTION:

The geomagnetic storm has been upgraded to a Severe category event as of 03:00 UT on 11 May. Minor to major storming is continuing and is expected to persist over the next six to twelve hours before stabilization begins to set in.

Strong auroral storming will persist through much of the local night sector over North America, possibly stretching into the evening for the Australian/New Zealand regions as well.

HF propagation conditions remain strongly degraded and will continue to remain strongly degraded for most of the next 24 hours. Some signal stabilization will likely be observed late in the UT day of 11 May. More substantial stabilization is expected on 12 May.

There is a continuing possibility for VHF auroral backscatter over the middle and some low latitude regions over the next 12 hours.

** End of Alert **

Not really true. The modems in the software for the DSPCARD 3 does include
a fractional-tap adaptive equalizer for 9600 bps G3RUH by Jarkko, OH2LNS.
It has been working for about a year now. If anyone is interested in the
implementation, the sources are freely available e.g. from funic.funet.fi
/pub/ham/dsp/packet/sources.zip (I haven't checked, but they are probably
also in tomcat.gsfc.nasa.gov and ucsd.edu). Twin modems for 9600 bps should
be OK with 56001 since OH2LNS's code does also KISS and HDLC and they consume
more horsepower than the modem itself.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 060 (OPDX.060)
May 11, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, K4CEF & the Southeastern Cluster Group, DXNL, DF4RD, OH2BU, AD1C, WU1F, N1GMU, KE2LJ, WK3N, W3YQ, WB3LHD, QRZ DX and VE3ICR for the following DX information.

1G2, ST. GEORGE ISLAND, USA. Ralph, K1RH, will be signing from here /1G2 for one week, starting May 8th. St. George Island has an IOTA of NA-085. Ralph will be active both SSB/CW and was heard May 9th on 14027 kHz around 2200z. QSL via K1RH.

4J1FS, MALYJ VYSOTSKIJ. The following is a press release uploaded to BARF-80 BBS from OH2BU: "It's the time to announce the 1992 DX-pedition to Malyj Vysotskij, 4J1FS. This year's DX-pedition ensures, that M-V Island will drop from all "Most Wanted"-lists, as the operation will last longer and have more stations on-the-air than ever before.The 1992 M-V Island DX-pedition is planned to be a two-week operation to start on Tuesday 26th of May, 1992 and to continue until Tuesday 9th of June, 1992. The operation is organized by club-stations OH2AQ, OH1AF and UZ1AWT. The callsign will be the same as in the three earlier DX-peditions of 1988, 1989 and 1991: 4J1FS. The operators will have the possibility to be on-the-air with five stations at the same time. Multiband beam and vertical antennas will make it easy to copy us on all bands. A multi/single contest operation will make it easy to find us even on CW in the WPX CW-contest held during the weekend of 30th to 31st May. RTTY! The RTTY station, with the possibility to other digital modes (AMTOR, Packet), will be on from the island, operation on these modes being mostly on the second week. WARC! A station with a WARC-band beam will activate the new bands 24 hours a day circulating between the bands on CW and SSB.
Frequencies will be:
CW: 1832, 3501, 7001, 14025, 21025, 28025 kHz
SSB: 1852, 3795, 7095, 14195, 21295, 28495 kHz
WARC: 10105, 18069, 18145, 24891, 24945 kHz
RTTY: 14084, 21084, 28084 kHz
The operators will be:OH2BU, OH2MAM, OH2BCI, OH2BVF, OH9KK, OH1EH, OH1NOA, OH1NSJ, OH1MDR, OH5BM, OH5MLF, OH2KI, OH2BOZ, UA1ALZ, RV1AW, UA1AKC, UV1AA, UT4UZ, UW1AE, UA1ARL, UA1CFL, UA1-1692475, UA3AKR.
QSL-route to be announced later. For more information please contact Jari, OH2BU. CU in the pile-up! 73!"

5R, MALAGASY REPUBLIC. G0CGL reports that 5R8GW shows daily on 21280 at 1800z. QSL via F6FNU.

5X, UGANDA. A station signing 5X5AA showed up May 9th on 40 and 80 meters operating CW. Little is known about this station, so WFWL! Check 7007 and 3507 kHz between 0130 to 0300z.

A5, BHUTAN. All reports of the operation by A5/HA5BUS are isolated so far and most seem to come from Europe. It was reported that G0CGL worked A5/HA5BUS on May 5th, around 1026z on 21013 kHz. Jim Smith, VK9NS, spoke with the A5 authorities on May 5th and they know nothing of the A5/HA5BUS operation.

FO, FRENCH POLYNESIA. Bob, FO5BI, is signing /P from Tuamotou Island (IOTA OC-066) for one more week. Check for him on 15 and 20 meters for CW (about 10 to 20 kHz from band edge). QSL via FD6HSI/F6HSI.

HH, HAITI. Pat, HH2PK, has been active on 12, 17 and 30 meters. Check 10103 kHz around 1045z, 18150 kHz between 1330 to 1830z and 24950 kHz around 1130z. Pat suggests sending QSLs via registered mail. HH7PV has been active on the 21345 net around 1900z. HH7PV has a new U.S. QSL Manager of AA5DW. HH6JH and HH2NL (Father John and Anita) have also been heard, but on the 14226.5 DX net.

P5, NORTH KOREA. A W6 station was reported saying some P5VR QSLs are being received in the U.S. (this is one of the calls that we all figured to be a pirate). No information as to whether they count, or even if the story is true. QRZ DX reports that OK1DTG signing /P5 is a member of the UN military force stationed on the border of HL and P5. It is rumored that OK1DTG has verbal permission to operate, but OK3JW says he does not.

VA8A. Tim, KQ8M, one of the Cluster SysOps of the Ohio/Penn Network will be active in the CQ WPX CW Contest in the 40 meter single band category. QSLs for VA8A for this year's contest only go to KQ8M. All 1991 contacts still go via VE3CDX.

XU, KAMPUCHEA. It was reported that stations in Europe were trying to work a station signing XU7VK. Supposedly, this station is running a 1KW linear and a 14 element log periodic. But if you remember back in March, XU8DX, went off the air after the Cambodian PTT confiscated all her equipment. So the legitimacy of XU7VK may be in doubt. WFWL!

VK0, ANTARCTICA. The QSL route for Graham, VK0NE, who we reported on last week, has the QSL Manager of VK9NS (Jim Smith).

IN THE MAIL. ZS0Z cards are now being received in the mail and all cards should be completely sent out by the end of June..... The XY0RR team is mailing out bronze medals to those who contributed to the Myanmar DXpedition. They are about the size of a half a dollar and they will have your callsign stamped on them. Some of the medals were handed out at the Dayton Hamvention.....

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS

online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

I have just the same problem with my very small 60cm dish on 10GHz.
If I move to a bigger dish (eg 2m) I will certainly need that sort of
accuracy or better.

I guess the EME experts would like that sort of resolution too.
I have not yet seen a commercial rotator/indicator with anything like
sufficient performance that I would want to buy it.

-than this.

-73, bob
- Bob Salnick, Spokane,WA | USENET: oliveb!isc-br!tau-ceti!DejaVu!salnick

me:
I didn't say 1/2 or 1 degree beamwidth - I said 2 degrees at the 1-dB
points. I do EME on 432 MHz (and higher, soon). My antenna has a
gain of almost 28 dBi. I don't know exactly what my 1 dB beamwidth
is, but 2 degrees is not unreasonable. Sure, the 3-dB beamwidth is
greater than 2 degrees, but when you're on the hairy edge of reception,
1 dB matters a lot. That's why pointing resolution is critical.

I wish I had received as many constructive answers to my question as
critical comments about asking it in the first place. :(

1999. Re: 2 meter ACSSB, Anyone ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 13:52:44 UTC
From: jpp@hpspdla.spd.HP.COM
Message-ID: <32920088@hpspdla.spd.HP.COM>
Source record: 290039

Gary,

So for every 20 KHz FM channel you could have four 5 KHz SSB channels at
the same* S/N. That is a very significant gain! How can you argue that
FM is better?

Tony Lymer, GM0DHD.

* Your estimate of the FM improvement is a little high. For a 5 KHz
peak deviation signal up to 3 KHz it is 6.2 dB.
I calculated the SSB S/N in a 4.5 KHz bandwidth but the speech part is only
2.7 KHz wide so the SSB is actualy 2.7/4.5 or 2.2 dB better than 17.2 dB
This gives an 18.2 dB S/N for the FM signal compared with 19.4 db for the SSB.
But what is a db between friends!

2000. dual-band HT information request

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 14:41:15 UTC
From: lrj@cs.cornell.edu
Message-ID: <1992May11.144115.20777@cs.cornell.edu>
Source record: 290049

(Sorry if this has been hashed out repeatedly, I've checked through all the stored articles on the news machine and found little information -- lrj)

Well, it's finally time for me to get a dual-band HT of some sort. I'm curious as to people's suggestions, reccomendations, and experiences with the current crop of dual-banders. Two of the main features I'd like to have are DTMF paging and CTCSS (PL) encode/decode. Ideally, I'd like to get a radio that's fairly small.

What experiences have people had with the Icom IC-W2A, Yaesu FT-470, and the Alinco DJ-580? Specific questions include:

What are the recharging options on the battery packs? With my IC-2GAT, the packs (BP70 & BP8) can be charged from 12VDC, the wall charger, or a "base" quick-charger.

When attached to a charger or 12VDC source (like in a car), is the case of the radio "hot" or at ground? I'd rather not have the thing blowing fuses anytime it touches something metal.

What kind of battery life can be expected from the "standard" packs? I spend a lot of time monitoring, and not too much time transmitting. Are the packs which come with the radio useable, or are they relatively worthless 30 minute wonders (like the BP70)?

How much audio output is available? I'm used to 400mW audio from the 2GAT. Is it relatively clean or horribly distorted?

Durability?

Thanks for the help. I will summarize whatever information I receive if requested.

All this discussion is why I feel the cost of the Landwehr preamps are
more than justified. I regularly run 180 watts into my 2 meter preamp,
it RF sense switches and I have never had a days problem with either it
or the 70 cm version which I run 100 watts into (RF sense switched). I
have run 500 watts into the 2 meter version at a June VHF contest with
the keying line used. No sequencer required, just close the relay and
go.

Having received testimonial after testimonial about intermod problems,
etc. with the ARR, and hating their RF sensed switching (which may have
drastically improved in the past 3 years), I tried the Landwehr's from
Henry Radio hoping for some small improvement. This was also after having
replaced the FOURTH device in my two meter ARR preamp (two from stupidity
and two from acts of nature). I cannot possibly be more impressed with
the difference in engineering (I couldn't resist peeking inside) or
the performance. I am stating my caveat that this is a three year old
comparison and for ALL I KNOW, ARR has changed their entire design.

Right Ascension of Ascending Node. You will have to compute sidereal time at Greenwich to compute the Longitude of the Ascending Node. The number underscored is the place on the sky that the bird would cross the celestial equator when going from South to North as seen from the center of the earth. Since the earth rotates under an orbital plane that is `stationary' in space, the Longitude changes as the earth rotates.

Message-ID: <1992May11.151748.7147@opusc.csd.scarolina.edu>
Source record: 290050

I want to thank all that responded to my request for information on the Knoxville-Oak Ridge area. I talked to some really nice people on some fine repeaters.

Next week I am headed to the west coast for business in and around
San Francisco. With my trusty HT in hand I hope to talk to some of you left-coasters between assignments. Any tips or info about hams in the area would be appreciated.
Also, there are few ham equipment establishments in my area, so any names of stores in the SF area would also be greatly appreciated.
Thanks in advance.

>Hams on Internet.

Don't feel bad, the list is somewhat out of date. I'm on the list twice (once here, once at smith@sndpit.enet.dec.com), but my job change was over 6 months ago. With the turnover on the net, I'd throw away adresses that hadn't been seen in 3 months... I'm not sure who's in charge of list maintainance.

>>or plug, you may need to use an FT-240 size core.)
>
>Anyone have a list of what materials are good for what frequencies?
>I'm particularly interested in 2M, 440, 900, and maybe 1200, FWIW. I
>got some ferrites at a local hamfest, but I dunno what material they
>are, I suppose I'll use them anyway.

Willie, we touch on this subject a bit in our RFI book, but better info
can be found in the Amidon catalog. Write to: Amidon, 2216 E Gladwick St,
Dominguez Hills CA 90220, (310) 763-5770.

These are the ferrites that I consider the most useful for EMI control:

Mix 43 - u=850. Good from about 20 MHz thru 450 MHz.

Mix 64 - u=250. VHF

Mix 72 - u=2000. MF and lower HF.

Mix 73 - u=2500. MF and HF.

Mix 75 - MF and lower HF - also known as "J" material.

Mix 77 - similar to mix 72.

Most of these, except mix 64, are actually usable over a fairly wide
frequency range if you wrap about 10 turns on a toriod core. Some of
these are avaiable only as ferrite beads. Watch out for "unknown" material,
it may be powdered iron, not very usable for EMC suppression, or it may
be designed for the audio range, or have a real low permiability, etc.
If it works, it is obviously of a useful mix and is okay to use,
but if it doesn't, don't be misled into thinking that a ferrite common-mode
choke won't fix your problem.

Good luck, Willie. 73, Ed.

|>Mike Owen W9IP
|>MROWEN@STLAWU

Sounds like an "absolute" encoder; those aren't nearly as common as the typical "incremental" kind (the ones you find in your synthesized rig). Plan to spend a fair amount of money. On the other hand, you should get the performance you need without any problem.

Don't mess around with the A/D board! The A/D may have 12 bits of resolution but that does NOT mean it has 12 bits of accuracy! More likely is 10 bits or so -- and then you have to factor in the errors introduced by the stuff in front of it. (Look at A/D specs: the cheaper ones often have "differential non-linearity" of 2 bits or more. That means that the last bit or two doesn't mean ANYTHING.)

Instead, take your encoder, and run it into a parallel digital port. You'll probably have to do a gray code to binary translation, since abs encoders use gray code.

Random question: is your antenna mount stiff enough that any of this has any meaning?

If it's tall enough to have aircraft warning lights on it, the FAA will have
lots of information about it. It may be identified on the aeronautical
chart for your area. If not, ask the FAA how to get the Obstruction
Database file entry for a specific object...

2010. Lookking for GMRS info?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 17:08:35 UTC
From: edc@NOC.Vitalink.COM
Message-ID: <1992May11.170835.16526@NOC.Vitalink.COM>

Howdy,

I'm continuing on my guest to find an affordable solution for a radio system to use for race car to pits communication. Since this is ametur racing (i.e. no money won, lots of money spent) I've been considering using HAM gear on 440Mhz as a possible option. I have a problem with this in that I don't always have the same crew and it get's diciny trying to get mechanics to study enought to pass the FCC tests (they's rather rebuild carbs than study yucky old electronics stuff).

Recently a friend mentioned that I might want to look into GMRS as a possible option. Great! But what is it? From what I could gather from my friend, it's a low power strictly non commercial mobile radio service, but it's not in the HAM bands.

So is it something that might be feasable for this?

What are the licencing requirements for stations and/ or operators?

Where does one go about finding GMRS HTs and waht could I expect to pay?

Thanks in advance for any info. By the way, please reply in english, I'm a racer, not a RF guru. Frankly, I wouldn't know a QSL if on jumped up and bit me on the QASS! :-)

Has anyone figured out how to use a cellular phone on the 900MHz
Ham band?
I have heard rumors that some cellular phone allow you to
monitor specific frequencys by special programing.

>could only sustain 25 watts in AM service. That was a fire bottle radio.

My TR4 owner's manual suggests that this particular rig does
better than 25 watts on AM. The description of AM operation
seems to indicate that the carrier level is modulated as a
function of the sideband level. What this means to me is that
while the resting carrier level might be 25 watts, the peak
carrier power is much higher. If I understand the manual
accurately, this seems like a clever way of generating high
peak AM signal levels without overstressing the finals.

>that there is more to the world than your own country. On UseNet, we in the
>USA are the ones who do this most often. I try to avoid it but it's an easy
>trap to fall into.

Maybe you are right when it comes to USA, but when conditions on 27 - 28 Mhz
are good enough one can hear numerous CBers from Italy, Portugal, Spain and
other countries in Europe. They can be heard even around 28.300...

>1) Educate - spread the word among amateurs to take every opportunity to educate
>CB users, radio salesmen, and others about licensing requirements outside the
>Citizen's Band. Take every opportunity to educate new amateurs about proper
>radio protocol. Don't forget any opportunities you can get from newspapers and
>broadcast radio & TV, if you can attract their interest.

We are doing that, although possibilities are limited... For example there was not a single ham exam in the last year (mainly because of the change of rules) - we expect exams to start at the end of this month.

>2) RDF - use radio direction finding to locate jammers and pirates. Take away
>their anonymity! This is a more difficult situation to handle - educate where
>possible, apply any legal means of pressure to the ones who won't cooperate.
>Be creative and share ideas with other amateurs. From your previous articles,
>I guess this step is already being implemented to some extent.

Some of us are doing that too. Resources are somewhat limited - to precisely locate someone one needs some equipment. Recently hams that are working on that field are mostly defensing 2m band - there were many illegal telephone links that operated on 2m band - some people even lost their telephone numbers.

>3) Complain to your government. Write letters - you now have elected officials
>who will need your votes to stay in office. Make sure they know how bad the

It is not so simple here. We have proportional representation - result: most of the government posts are occupied by member of parties that got 14% of votes in last election, and parliament that is unable to produce any stable majority. But we are doing what we can...

>I realize that I've just suggested that you and other amateurs in Poland do a
>lot of work. As a minority, it may be impossible. But if you don't try, it's

There is approximately 6.000 hams in Poland, and maybe 3.000 of these are currently active. These numbers are expected to rise after examinations will start again - many people finished their classes and are waiting for exam.

>One thing amateurs do well is "spread the word." Try to get this message to
>all the amateur radio clubs or groups (or whatever equivalent exists in
>Poland.) If you don't have amateur radio associations of some kind around the
>country, it's time to get them started and work together toward these goals.

We have one, PZK (Polish Radio-Amateurs Association) was formed in 1930, and was one of those associations that formed IARU. We have approx. 4.000 members.

>On a final note, let me assure you that the situation is not as bad in other
>countries. I think there is concern about CB in most countries because it
>has many loud and unruly users. But there are law-abiding citizens in there
>as well. (I personally know many of them - they are not difficult to find.)
>You should try to recruit the law-abiding ones to amateur radio and try to
>constrain the unruly ones to within the Citizen's Band.

You are right - but I think that CB is the place that encourages to behave badly, just like possession of guns encourages murders.

2017. Mobile antenna noise?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 18:17:01 UTC
From: cvm@nauvax.ucc.nau.edu
Message-ID: <11MAY92.18170128@nauvax.ucc.nau.edu>
Source record: 290028

I have a Radio Shack 2m 5/8 wave mag mount mobile antenna. This anntenna picks up noise that doesn't seem to really be there. I am using this with a Kenwood HT. The symptoms are that the S-meter intermittently shows a signal that varies significantly in strength . On most frequencies there is no modulation on the radio does not break squelch. On some frequencies there is modulation (lots of noise) and the radio does break squelch. This makes scanning useless. The problem seems to get much worse when I am building that is two or more stories high. If I remove the mobile antenna and replace it with the rubber duck or a telescoping whip the problem goes away. I also do not see the problem from my j-pole antenna mounted on my house.

I tried to ground the shield of the coax to the car, but this did not help at all. I also tried different power sources. I tried the battery pack, an external battery pack, the car cigarette lighter with the car running and the cirgarette ligther with the car turned off. I still see the same problem with all of these power sources. This problem occurs in both of my cars.

I haven't tried transmitting with this antenna because I haven't recieved my license yet (7 1/2 weeks and counting) and haven't had a chance to get a friend to test it.Tomorrow I am going to borrow a friend's 1/4 wave mobile and see if it has the same problem. If it doesn't have this problem I am going to return my antenna and buy a different one. Does anyone have any idea what is causing this problem?

I often hear the statement that the 58-foot length of RG-58 coax is a "matching section". When will we get the notion out of our collective heads that you can use 50-Ohm characteristic imoedance line to match to 50 Ohms. If the swr is 3-to-1 at one end of the line, it will be 3:1 at the other of the line is low loss. RG58 has low enough loss at hf, especially if it's only 58 feet.

Now if you're using the LOSS of the cable to accomplish the match by changing the constant vswr circuit into a spiral trajectory which ultimately ends up at the 1 + j0 point, you are throwing the baby out with the bath water.

Almost everyone I've talked to who uses a G5RV, and there are very many of them, tell me they use a "tuner".

Personally, if you're running any lowloss ladder line at all, run it all the way to the shack and forget the coax.

A side-note to this discussion: the problem of RFI to incompetant equipment may soon get better. According to a very brief survey article in this month's EMC Test & Design magazine, the European Community is apparently going to be requiring fairly string electromagnetic compatability standards for equipment sold in the EC starting in 1995. This should make it easier to find consumer electronics which won't be affected by every transmitter in a 100 mile radius.

Probably the US won't adopt any official standards (in fact, US representatives at international working groups apparently have been whining about reducing several standards); hopefully we won't become the world's dumping ground of equipment that isn't legal for sale anywhere else.

Well, now that you mention it, I have been having trouble with Super Morse 3.16 on a Texas Instruments TravelMate 2000. The dot/dash duration timing seems to get all messed up. I have had no troubles at all with Super Morse 3.16 on a Zenith SuperSport, however. I haven't had the time to properly try and characterize the causes/manifestation of the problem, so it could very well be something that I set up incorrectly on the TI. Has anyone else encountered this, and if so, any suggestions on what I could try to correct it?

/\

MIDDLE LATITUDE AURORAL ACTIVITY WARNING

DOWNGRADED: 18:00 UT, 11 MAY

/\

The middle latitude auroral activity warning has been downgraded to a
WATCH as of 18:00 UT on 11 May. Conditions are no longer strongly favorable
for observations of middle latitude auroral activity. There will remain a
slight possibility for detecting occasional sporadic periods of weak auroral
activity from the middle latitude regions (northern tier of the U.S. states
to about 55N latitude over Canada), although any activity observed will be
post-storm residual substorm activity that will be quite localized in nature.
This WATCH will remain active until 18Z on 12 May when it will be updated or
allowed to expire (cancelled).

** End of Warning **

>away from the main frequency.

Unfortunately, NBFM (Narrow band FM) has two different meanings depending
on the context. In land-mobile (or Amateur VHF) terminology, it means
5 kHz deviation (about 13 kHz bandwidth), as opposed to the old
"wideband" 10+ kHz deviation.

In the HF region, it means "no wider than an equivalent AM signal" which
translates to a modulation index of 1 (less than 2 or 3 kHz deviation,
bandwidth less than 6 kHz.)

>problem and still seems to have some gain...is it now a Zepp5RV?

I suspect the main reason the coax helped was the difference in
feedline length. Some people use a 1:1 balun at the junction
between coax and balanced line, which should help with the
"RF in the shack."

The G5RV is a good limited-space, multiband antenna that has a
"reasonable" SWR on the 5 major ham bands 80-10 meters. As
I recall, the antenna typically has an SWR below 3:1 or so
on each of these bands, which is low enough to easily be
tunable with a transmatch. The old tube-type rigs generally
had enough matching range that you didn't need the tuner.

I would first call up ICOM and confirm that there is no commercial version
of the IC24. Then I would call up the nearest FCC office (should be in
your phone book) and ask them who to send a report to.

Quite a few. They're used all over the place.

> Anyone had experience with this stuff?

My roommate had a summer job launching these things under an EPA
contract. You put the thing together, dunk the battery in water,
fill the baloon with helium and let it go.

2033. Kenwood TH-78A Initial Impressions *LONG*

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-11 19:56:41 UTC
From: aviator@athena.mit.edu
Message-ID: <1992May11.195641.18409@athena.mit.edu>
Source record: 290037

What follows is a relatively long write-up reflecting my initial impressions of the Kenwood TH-78A. To summarize: Hot radio, but no info yet on mods, out-of-band TX/RX, or cross-band repeat. Kenwood has some information from Japan, but it hasn't been made public yet.

Please do not distribute further. Please do not distribute on packet.

...Joakim

--- CUT HERE ---

Here are my initial impressions of Kenwood's new dual band handheld, the TH-78A. I purchased it at HRO in Salem, NH. If memory serves, their price is $529.95, but I paid $509.95, based on matching a quote from Austin Amateur Radio Supply. I also bought ANLI's replacement telescoping dual band HT antenna, and ordered the SC-35 soft case, which arrived from HRO's Virginia store a few days later. Just a few days ago, I bought the ME-1 memory expansion unit from the Salem store, more about it later.

The TH-78A is a dual band handheld, with the capability of cross-band duplex operation and dual in-band receive (i.e. receive two VHF or two UHF stations). In the U.S. version, tone encode/decode as well as DTMF encode/decode are built in. Nominal output power is 2 W with 7.2 V DC input; increasing to 5 W with 13.8 V. Two intermediate power levels are available: Low (0.5 W) and Economy Low (20 mW on VHF, 10 mW on UHF). The standard TX limits are 144-148 Mhz on VHF and 438-450 MHz on UHF. RX limits are 118-174 on VHF (118-136 is AM) and 438-450 MHz on UHF. At the time of writing, no information is available on out-of-band TX or RX, cross-band repeating, or other mods. As far as I can tell, the infamous Kenwood green wire is absent from the TH-78A.

Prior to this radio, I owned a Kenwood TH-27A 2m handheld. I bought it almost exactly one year ago, and added a whole bunch of accessories over time, almost all of which are compatible with the TH-78A. So, I now have the following TH-78A accessories: SMC-33 remote control speaker mike, HMC-2 headset with VOX and PTT, BC-15 desktop charger, BT-8 battery case, PG-3F filtered cigarette lighter adapter, PG-2W DC cable, and BH-6 swivel mount (on order). Additional accessories available include: SMC-31 and SMC-32 speaker mikes, TSU-7 CTCSS unit (standard with US version), BC-14 wall charger (I think this is the same one that comes delivered with the radio), PG-3H cigarette lighter adapter (what's the difference between it and the PG-3F?), SC-36 soft

case (for new nicads, see below), and WR-2 water resistant bag.

The TH-78A has the same nicad form factor as the TH-27A/47A, and the new TH-28A/48A radios. The standard battery is the PB-13, a 7.2 V 700 mAh nicad which slips inside the radio, with no protrusions. Also available are the PB-14 (12 V 300 mAh), and two new ones: PB-17 (12 V 700 mAh) and PB-18 (7.2 V 1100 mAh). I don't believe the PB-14/17/18 will fit the SC-35 soft case. I think the SC-36 soft case is intended for the PB-18. I can only guess that the PB-14 and PB-17 could be used with the SC-36 provided some sort of foam block was used to fill the gap. I've only owned the PB-13 standard battery, and have never felt a need for a 5W battery pack or a higher capacity 7.2 V pack. I use the BT-8 AA battery holder for back-up situations.

The TH-78A replaces the TH-77A dual band HT, which used a different battery form factor. While the TH-77A may be available in limited quantities at reduced prices, I believe it is being discontinued. The same applies for the TH-27A/47A. Incidentally, since it seems that Kenwood is going to stick with this new battery form factor for a while, I have reason to believe we will see third party replacements soon. This is based on a brief telephone discussion with someone who runs a battery business.

The TH-78A comes shipped with the radio, a rubber-duckie dual band antenna, a belt clip, a hand strap, a rubber cap (covers the DC in, mike, and phone jacks when not used), a wall charger (I know of some TH-27A owners who use the wall charger to power the radio at the economy low power setting), a battery pack (PB-13), a manual (including schematics), and a warranty card. The warranty covers one year.

First impressions: It's very compact and heavy on features. Size wise, it's only about half an inch higher than the TH-27A. With the standard rubber duckies attached, the TH-78A is actually shorter than the TH-27A. The other dimensions are roughly the same. With a 7.2 V 700 mAh pack, this must be the smallest dual band handheld available. The overall size is very comfortable, as is the shape of the radio. Aesthetically, it's also very pleasing - it doesn't have the toy feeling the Icom 2PAT does. However, operators with larger hands and fingers than mine may complain, especially about the front key pad. Also, I would recommend that prospective buyers wait until the mod info has been made public.

The top of the radio has a standard BNC connector, with a small gap for fitting the rubber cap; DC in/mike/phone jacks (compatible with other Kenwood handhelds, something Icom could learn from), and two rotary encoders. The rotary encoders have an outer (lower) dial for squelch (one for each band), and an inner (upper) dial for either volume or tuning (see below). The

volume/tuning dial has discrete settings, which I think is a nice touch. On the TH-27A I often bumped the volume setting down to zero, accidentally missing transmissions. There are also two LEDs, one for each band, located next to the rotary encoders. The LEDs are two-color ones, a green light indicates open squelch (equivalent to the "Busy" indicator on other Kenwood handhelds), a red light indicates TX. I'm still undecided about this arrangement, but at least the LEDs are more visible than the single LED was on the TH-27A.

The front panel has the power button way on top, two large circular buttons (MESSAGE and BAND) below it, a speaker (pretty good audio: high volume settings yield little distortion, but some noise), a large LCD display divided into two segments by a horizontal line on the glass cover, a 16 button keyboard, a sliding cover which "protects" the keyboard, and a microphone (just below the keyboard - a pretty good location). I have mixed feelings about the sliding cover; it's on pretty securely, although I had no problems removing it (it's useless with the soft case). The radio looks sharp with all the keys hidden, but I doubt that it has much value except maybe for avoiding hitting any keys accidentally. I find that the sliding panel slightly hinders using the bottom row of the keyboard. In fact, because the keyboard is slightly recessed, the bottom row is a little bit more difficult to use than other rows even with the keyboard cover removed. I also find the power button slightly difficult to activate, although its location and size is a definite improvement (the TH-27A was difficult to power on and off in the dark). I guess one advantage is that once the radio is on, it will be difficult to turn off accidentally.

The left side panel has buttons/keys for PTT, LAMP, MONI, E.CHG (encoder change, see below), MHz, VFO, MR, and CALL. The PTT, LAMP, and MONI keys have a very satisfying feel with a nice "click" - a definite improvement over the TH-27A. The CALL button is too small for my taste. The right side panel only contains an attachment loop for the hand strap. The back panel has attachment points for the belt clip (or optional swivel mount) and a sliding release for the battery pack. I find that the battery packs are easy to insert and remove, unlike the Icom 2PAT. I've never had any mechanical problems with the battery packs on my Kenwood HTs. The bottom of the battery pack has connectors for charging with the BC-15. The soft case must be removed prior to charging the radio or removing the battery pack. The soft case is OK, the fit isn't ideal, but it serves its purpose very well - my TH-27A went through a year of hard work in nearly mint condition. It also provides a convenient way for attaching the SMC-33 speaker mike clip to the radio.

The LCD display is much larger than that of the TH-27A and represents an overall improvement. It seems much easier to read.

The top segment of the display shows both frequencies side-by-side, whereas the lower segement is used for information such as memory channel, volume setting, and alphanumeric messages. Alphanumeric messages are displayed using line segment combinations (HP-41 style). Various status flags are displayed in both segments of the display.

Light is provided by what appears to be four green LEDs, one in each corner of the display, a definite improvement over the TH-27A. The front 16 button keyboard is also lit, but not the other keys. To the best of my knowledge, to date only Yaesu has provided lit keyboard on HTs. Both the display and the keyboard lights are activated by pressing the lamp key. The two lights cannot be controlled separately. The lights stay on for 5s after the activation of any key. Alternatively, one can press the F key followed by the lamp key, in which case the light stays on until the same sequence is repeated.

The user manual is mediocre. While most features are explained adequately, it appears that only the bare minimum of information is presented. Furthermore, the manual suffers from the standard Japanese manual problems. As a former student of Japanese language and culture, this is of some interest to me. The following three problems seem to be systematic:

(1) Misspellings and typos (e.g. "lamp kay").
(2) Poorly constructed or confusing sentences (e.g. "when you press and hold the E.CHG. key, each control temporary control of the volume or tuning control passes to the VHF band").
(3) Patronizing statements (e.g. "Please study these controls carefully. By the time you reach the end of this manual, you will have had to use each of them many times").

But, I digress...

The user interface has much in common with the TH-27A, but not as much as I'd like to see. As usual, most keys can perform about four functions. Pressing the key alone provides the primary function. Pressing the F key first, and then the key, performs the secondary function. The primary and secondary functions are labeled on the keyboard. Color coding is used to separate some functions (primary in white, secondary in blue, DTMF pad in red). Other, unlabeled functions, are obtained in several ways: Pressing the F key for appr. 1 second, then a key; pressing the M key, then a key; pressing the M key for appr. 1 second, then a key; and pressing a key during power up. These auxiliary functions, while not labeled, are normally used infrequently and, in Kenwood's defense, an attempt has been made to provide some sort of connection to the key label. Scanning is initiated by pressing either the VFO, MR, or CALL key for one second. So, while the user interface isn't great, it's adequate and

occasionally reflects some design intelligence.

In order to remain compact and avoid three rotary controls, Kenwood has introduced a sort of user settable rotary encoder. The outer dials always control squelch. The inner dials however, can be configured in several ways:
(1) Left dial controls volume of main band and right dial controls tuning of main band.
(2) Left dial controls volume of sub band and right dial controls tuning of sub band.
(3) Left dial controls volume of VHF band and right dial controls volume of UHF band.
(4) Left dial controls tuning of VHF band and right dial controls tuning of UHF band.
Without going in to great detail, the desired configuration is selected by the E.CHG key. You select a default configuration, and can then temporarily select other configurations using the BAND key or the E.CHG key. It's a little bit confusing at first, and the E.CHG key is a tad difficult to activate, but it works. I prefer configuration (1). However, while there is an indicator showing which is the main band, there is no way of knowing what the current encoder configuration is short of turning the two dials.

When you change the volume, a volume indicator is temporarily shown on the display (a "V" followed by a number indicating the volume level). Volume levels range from 0 (mute) to 20. Unlike the TH-27A, the beeps and audible tones generated by the radio appear to go through the same amplification path that receive audio does. This has two side effects: The mere pressing of any key generates a bit of white noise as the speaker is activated, and the volume of the beeps vary with the volume setting. I like the second feature: On the TH-27A the beeps were so loud that it was almost painful when using certain earphones. The audio feedback provided by the TH-78A is nearly identical to that provided by the TH-27A. The beeps can be turned off entirely, if desired.

Like other Kenwood handhelds, the TH-78A operates in three basic modes: VFO mode (permits direct keyboard frequency entry), MR mode (memory recall, using programmed memories), and CALL mode (call channel only). There's a key for each mode (this differs from the TH-27A). The VHF band and the UHF band can be in different modes; however, there is only one call channel. In the VHF VFO mode, the transition between AM (118-136 MHz) and FM (136-174 Mhz) is seamless. I don't know if it's possible to turn on AM detect manually outside the 118-136 MHz segment.

From a performance perspective, I can't report much. Receive audio is satisfactory, although there seems to be a little bit more white noise (but less distortion). Transmit audio reports

range from good to muffled or slightly distorted (with the SMC-33, but mine's been banged around a little bit). When using the dual in-band receive feature, image rejection or sensitivity can be reduced (there is a warning to this effect in the manual). In fact, I've found a birdie which exists with 146.61 in the VHF band and 148.15 in the UHF band. If I reverse the frequencies however, the birdie disappears. The radio uses two 1st IFs (45.05 MHz and 58.525 MHz) and a 2nd IF (455 kHz). Maybe someone who understands the theory involved, can do the math for me and explain the birdie. I've reproduced this problem on two brand new TH-78As. It is not as prominent with the standard rubber duckie antenna attached, however. Btw, I've seen a report that the rubber duckie antenna is narrow-banded.

I also get interference (squealing/whistling noise blocking out the received signal) on 146.61 when using my Larsen mag mounted 5/8 wavelength antenna. This problem is not reproducible with other antennas. It only occurs when 146.61 is used on the VHF (left) band. I'm open to ideas as to what may be causing this. Two suggestions are poor RF ground or a short in the coax (I've tried to test for the latter, with negative results). It will be interesting too see whether switching to a dual band whip solves this problem. In any case, I'm not too concerned, since I'm planning to buy a mobile radio, and I've ony been able to reproduce this problem under very specific circumstances.

In terms of intermod or rejecting unwanted signals the TH-78A appears slightly less capable than the TH-27A was, but this is to be expected from a dual bander. Except for certain well known problem areas (e.g. Route 128 near Burlington and Waltham, MA), this is usually not a problem.

The TH-78A has a default of 40 channels and one call channel. Each memory can hold RX frequency, direction of offset (or TX frequency for odd splits), tone frequency, tone encode on/off, tone decode (CTCSS) on/off, DTMF encode/decode (DTSS) code, DTSS on/off, and reverse status (i.e. RX/TX frequencies reversed). Every channel can contain an odd split. A nice feature is that no differentiation is made between VHF or UHF memories; you can mix and match at will.

Normally, the radio memories are assigned numbers, starting at 0. In the standard configuration you get channels 0-39. With the optional ME-1 EEPROM expansion unit, 250 memories are available (0-249). You can choose between 1-digit (0-9), 2-digit (0-99), or 3-digit recall (0-249) mode. If, let's say, you select 2-digit recall mode and have the ME-1 installed, channels 100-124 would not be available through keyboard entry, only by using the rotary encoder.

The radio can be put in a memory channel character display mode, where a 6 character alphanumeric label is assigned to each

channel. Channels are still selected by their memory number, however. I have the ME-1 and really like this mode, as it helps me keep track of what I've stored. The entry of letters using the 16 button keyboard is pretty well thought out, and becomes natural fairly easily. The keyboard is labeled just like a touchtone phone key pad, with the addition of "Q", "Z", and "Space" (not labeled) assigned to the 1 key. The trade-off with using this mode is that it halves your memory capacity. This is a non-issue with the ME-1: having 125 channels is providing to be more than adequate. :)

The TH-78A will do time operated scan or carrier operated scan (the TH-27A had a third mode, seek scan). The mode can be set independently on each band, but switching modes requires pressing the 8 or 9 key while powering up - not very convenient. The following scan options are available: Memory scan, band scan, programmable band scan, MHz scan, VFO/Memory scan, CALL/VFO scan, CALL/Memory scan, and VFO/Memory/CALL scan. The scan rate appears to be about the same as the TH-27A. A nice feature is that you can scan on one band, while receiving on the other (this also works for dual in-band receive). However, when using the HMC-2 headset a slight clicking noise is heard during the scan. Memory channels can easily be locked out from scanning.

An alert function is available, where Channel 1 is monitored every 5 seconds. If any activity is detected, a beep heard. On the TH-27A you had the option between a beep alarm or automatically changing to Channel 1 when activity was detected. I never used this feature much on the TH-27A, because an annoying burst of white noise was heard every five seconds when checking the channel. This problem has seems to have been eliminated from the TH-78A, however.

When transmitting, pressing any key on the front key pad sends the corresponding DTMF tone. A feature can be activated which causes the transceiver to remain keyed for 2 seconds after pressing each number. This allows you to release the PTT key after pressing the first number. This seems like a nice feature, but on the repeater I use locally this somehow confounds the controller, and it doesn't recognize the DTMF sequence. Ten autodial memories are provided (15 digits each from the set 0-9, A-D, *, and #). In receive mode, the DTMF memories can be used to operate the TH-78A as an expensive telephone dialer.

I'm not going to describe the details of CTCSS and DTSS, it's pretty standard. Squelch settings can be set independently for each band. DTMF paging is also supported, allowing you to page an individual station or a group code. Eight paging memories are provided. I find this to be primarily a gadget feature; I wonder if there is anyone out there who actually has a practical need for this?

A new feature, with extreme gadget value, is the ability to send and receive 6 character alphanumeric messages in the DTSS or paging modes. I believe that each letter of the alphabet is defined by a DTMF triplet: a #, followed by a digit 0-9, followed by a letter A-C. Each combination of a digit and a letter corresponds to a position in the alphabet. Ten memories are provided for sending or receiving these messages. The only worthwhile aspect of this feature is that message memory 0 is a power on message, which is shown briefly after powering up the TH-78A. The default message is "TH78A", but it's kind of neat to have it come up with your callsign, name, or favorite 6 letter greeting (how about making the default message "BUY ME"?).

A tone alert system lets the radio stay quiet until a signal is received, at which point one of two user selectable alarms is sounded (I like the telephone type ring). I could see that this could be useful in combination with CTCSS and DTSS. Tone alert is independently selectable for each band.

The mixing of the audio between the main and sub bands is user settable. This only affects operation with an external speaker or headset. Main and sub band audio can either be mixed or separated, and they can be placed either on the internal speaker or external speaker. All combinations of sub/main band and internal/external audio are possible. Nice touch. However, even when no internal audio is selected, a very low level of audio (almost noise) is emitted from the internal speaker when a signal is received. This seems strange, but it actually turns out to be pretty neat when working packet, since audible feedback is provided for incoming packets. The capability of splitting the main and sub band audio provides the capability of monitoring a voice channel while working packet - very nice.

When using VHF and UHF simultaneously, full duplex is available, for telephone style conversations. It is possible to mute the internal audio; an attempt to avoid feedback. However, this feature is best used with a headset. This feature is not available when using dual in-band receive.

Dual in-band receive (simultaneous reception of two signals in the same band) is activated simply by pressing the f2 key. You have the option of monitoring 2 VHF frequencies or 2 UHF frequencies. You can still transmit on the main band, but the sub band is muted entirely during transmit. As mentioned earlier, certain combinations of frequencies (I've found one) will cause birdies.

In addition to an internal clock, various timer functions are included. When the clock function is activated, the time is displayed in lieu of the sub band frequency, but sub band reception continues. When operated in single band mode, the time can be displayed next to the frequency. Like the TH-27A, a switch-on timer and switch-off timer is provided, which can be

used as a reminder for nets and skeds. The switch-on timer can be configured to sound a 10 second alarm in addition to turning on the radio.

Other keys/features include MONI (opens squelch to monitor frequency on the main band), LOCK (disables all keys except LAMP, MONI, E.CHG, LOCK, and PTT), muting volume for using earphone (however, this also mutes the speaker volume; not a very useful feature), ABC (automatic band change, switches PTT control to sub band when a signal is received), optional single band operation, MHz (tunes in 1 MHz steps), channelized frequency display (shows channel number instead of frequency), battery saver mode (with user selectable sleep times), and APO (automatic power off: alarm sounds after 59 minutes of inactivity, 1 minute later power is switched off).

Installing the ME-1 required opening the radio. Four screws need to be removed. Opening and separating the two radio halves was a tad more trickier than the TH-27A, but not overly difficult. The same applied for closing everything back up. Beware of the two tiny o-ring rubber seals placed over the two LEDs on the top panel. These have a tendency to fall off when opening the radio. Installing the ME-1 was straightforward, although quite a bit of force had to be used in order to insert it fully into the socket (no metal conductors should be visible when fully inserted). The internals of this radio are amazing, even for a non-techie like me. Nearly all components are surface mounted.

In summary, I'm very pleased with this radio so far. I'm still waiting for the CAP TX mod, however. What sold me on this radio was the ability to monitor two VHF frequencies simultaneously. For CAP operations, this is particularly handy. I can now monitor a CAP voice frequency and 121.5 (ELT/emergency frequency) simultaneously. Or, I can get the airport ATIS while using another VHF frequency. Or, monitor a voice channel during packet operations. Or, a National Weather Service station. The possibilities are endless. Also, I probably wouldn't have bought this radio if it had not been compatible with the TH-27A series of accessories. I believe this radio will be very competitive with the Icom W2A. In my opinion, this is the first Kenwood dual band handheld to be taken seriously.

Thanks to all those who responded about my TS120S problems. Tightening the
PC board screws solved the problem. As I purchased the rig from afar, something
probably happened during shipment.

Again, thanks for the help! This newsgroup is a great resource!

Of course you are right, Bruce, but by definition 3rd order Intercept
is an imaginary point. However, since it is an absolute number, it
can be used to compare different receivers, which dynamic range can't.
However, take a look at your numbers and you will see that there is
significant IMD at levels below the blocking level of the receiver.

>All you have to do is add two numbers to get more useful information out of
>and IMD:

Onset Onset
Rig Desense IMD
dBm dBm

IC-745 -25 -48

>Each of these two numbers, and MDS, tells you something. Since IMD is a

>a single-strong-signal environment. Also, IMD products tend to get bad
>very quickly with sources above the onset of IMD, so the IMD floor is very
>important when trying to pull out weak signals in the presence of strong
>ones (e.g., contest situations, 40m).

IMD isn't a problem for me at the noise floor of the receiver. (The
"onset of IMD"). The ARRL implies that it is, though, by utilizing
"spurious free dynamic range" as a measure of the worth of a receiver.
IMD products at -140 dBm don't hurt a thing.
Your use of the term "IMD floor" is an interesting one and I am not
sure if that is a term used in the industry or if there is a standard
definition for it. I assume you mean the raised noise floor due to lots
of IM, which would be caused by many large signals of varying amplitude
(especially with SSB in a contest situation). It would start to be a
problem if it was in the range of -110 to -100 dBm on a contest band.
What level of interfering signals would it take to cause that level of
IMD in a given receiver, I would want to know. And then determine if
any of my neighbors could drive that level of signal down my coax.

In the real world, there will seldom if ever be a situation where the
textbook IMD situation will occur. (Two equal strength signals, etc.)

There will actually be IM caused by unequal signals, more than two of them, a mixture of cw and ssb, etc. But you have to have a standard to measure by and that is what the intercept point is.

Good discussion. Thanks for the comments.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
What exactly are you doing here? I'm assuming that the full 4.5 KHz will
need to be passed for the pilot recovery. Now, if you assume after this
the whole signal is passed through a 2.7 KHz filter and then synchronous
demodulated, fine, but there still is a need for the original pilot to
be passed in an ACSSB system! This kinda implies some second order effect
which may be analogous to the threshold effect in FM. The S/N for the pilot
would be different than for the audio! GAK!! -- this is really complex...
and I think the complexity of a good system for ACSSB is the main point
of its disuse. Now, I agree with Gary on the multiple use of spread spectrum
transmitters with different correlation---that shows more promise than ACSSB.

I imagine the pilot recovery PLL would be a bit of a nightmare on ACSSB!

>This gives an 18.2 dB S/N for the FM signal compared with 19.4 db for the SSB.

>problem from my j-pole antenna mounted on my house.

It sounds like a commercial transmitter (or something to that effect) is
overloading the front end of your HT. Now, the J-pole should have about the
same amount of gain as the 5/8, but it is in a fixed location.

Here's what I'd try: Use a different radio with the 5/8 (try a friends on
it) or try moving the J-pole to the same locations as the 5/8 and see
if the problem still exists.

Also, there may be a very remote chance that somethings getting rectified
in the antenna, if thats the case, I'd return it! (check your connections
first)

Message-ID: <1992May11.221816.5843@nntp.uoregon.edu>
Source record: 290051

Does anyone have any experience with an Icom 730?

What hass been your experience with the receiver? Was it sensitive enough for you? How 'bout the filtering system? Did they perform well?

Also, is there a modification available to allow the rig to transmit on the WARC bands?

Thanks for any info.

THE KENWOOD 440 OR 450. I AM A RECEIVER BUFF, THOUGH, AND WANT A VERY GOOD GENERAL COVERAGE RECEIVER AND A VHF/UHF SCANNER WHICH ALSO "TALK" THE FREQUENCIES. ARE THERE ANY RECOMMENDATIONS FOR SUCH RECEIVERS? I WOULD LOVE SOMETHING LIKE A BEARCAT SCANNER, BUT WITHOUT VOICE SYNTHESIS, IT'S USELESS. I KNOW THAT THE KENWOOD 450 WOULD GIVE ME GENERAL COVERAGE RECEIVE WITH THE VOICE, BUT I WANT A BETTER RECEIVER THAN THAT. ALL SUGGESTIONS ARE WELCOME.

As well as "talking" receivers, you could use any one with an interface which allows a computer to query the frequency. Then you can use whatever you have come up with for computer interfacing, such as directing output to the "speak:" device on an Amiga.

Some programming may be required, but it will give you a lot wider selection than just talking radios.

Source record: 289803

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil in the directory pub/space.

I'm sorry that I can't tell you about '88 Hondas, but both my '89 Accord and
my wife's '90 Civic are absolutely clean. Of course, we take the normal
precautions, such as running power directly from the battery, large braid
ground straps, using a Motorola hole saw to ensure a good ground for the
antenna, and such.

Most noise problems that I have seen in Hondas are due to either inadequate
grounding or to running power from the ignition system rather than the
battery. If you want the radios to power down when you turn off the key,
use a relay - but power them from the battery.

>out with the bath water.

Let's get something straight...the loss of the feedline is NOT being used
to match it to 50 ohms...the twin lead is set up as a matching transformer...
the impedance of the twin lead matching section is much higher than
50 ohms...check your basic electromagnetics. The 58 foot matching section
IS NOT RG-58 BUT TWIN LEAD. It goes from the rig to a 4:1 balun to a
58 foot twinlead matching section to the antenna.

If the G5RV is wide and clear, out in the open, a tuner isn't needed.
I should know. I've used one for two years.
If you're going to criticize the G5RV, know how it's built first.

I use the AEA unit on a Sony 2010 with pretty good results. Besides
the Norfolk Virgina broadcasts I have also received Fax on the following
frequencies:

4.270 & 10.535 MHz - Iceberg maps, Halifax Canada

8.040 & 4.610 MHz - Weather maps centered at north pole. Source???

4.704 MHz - Weather Fax/ Satallite pics of N. Africa + Middle East
I think it's from a US naval station in Spain.

3.242 & 7.530 MHz - New England Marine Fax, U.S. Coast Guard in Boston
0530 and 1730 UTC.

12.753 MHz - WEFAX, Canadian Air Force.

I am also interested in any other frequencies, especially wire photos.

>>> whose output is an analog voltage?
.....stuff deleted.....

Your A/D converter board is unlikely to have better accuracy than
a high precision pot. The ones used on older VOR receivers had
an accuracy of about 1/2 degree to 2 degrees, depending on make
and model. That would work out to better than .1 % accuracy in
the best case. THere are some test equipment pots used in component
bridges that are rated for .1 % as well. An 8 bit A/D converter
would have a **best** case accuracy of about .5%. A 12 or 16 bit
would have much better resolution of course--but not always that
much greater accuracy.

You can use syncro resolvers to get 1/4 degree accuracy, and they will
rotate around and around--after all, they were used for years in
radar antennas fir positioning.

Agree with Roy. Extra'a in the time period of 1976-77
who had the "ability" to choose, got one by two calls when
available, followed by two by two when the 1X2 were gone.
The rules back then allowed one to reclaim former calls,
for the price of 25 bucks and if it hadn't been re-issued
or had been expired more than five years.

Be it to whatever reason, fat fingers; cant read handwritten notes,
callsigns in the original "sour grapes gram" should have read
WA 2 Oscar Delta Hotel and WB 2 Oscar Delta Hotel
far from extra class callsigns; there are no doubt other examples.

If I've offended soomeone, sorry. Not saying that something
sneaky was or has been done.

2056. 2meter 70cm usage on 12 foot TVRO dish

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 07:11:57 UTC
From: saul@nsq.uucp
Message-ID: <189@nsq.uucp>
Source record: 289939
Cross-posted to: rec.radio.amateur.misc,rec.video.satellite

Hi, I'm currently in the need of using my TVRO 12 foot
dish for receiving and transmitting on the HAM 2meter
and 70cm bands. I would also still like to use it for
TVRO purposes (not needed at the same time), but would
like to have all connections present to my LNBs..

Is it possible to transmit, lets say 70watts around
the LNBs without killing them or the TVRO receiver??

Do I have to remove the LNBs (C and KU) or can I leave
them there and have a helical coil around my feedhorn
as my transmitting and receiving point for HAM use?

Any comments would be helpful..

I started not to comment on this but no one has made much of any useful
suggestions.

If you insist on using an analog input to your computer - something
I'd not recommend with the degree of accuracy you need - simply
put a precision low temperature coefficient pot on the antenna and
linearize it in software. For about $20 you can pick up a 2 foot
diameter degree wheel from any of the hotrod cam vendors.
Simply build an translation table in your software every degree or
so and interpolate between them. With a bit more work and a transistor
driven constant current or one of the Analog Devices temperature
senders, you can temperature compensate the pot using another input
to your A/D board.

A vastly better solution is to get an inexpensive 12 bit absolute shaft
encoder, lash it up to the mast with a taunt band coupling and
couple this to your computer with a parallel port. Build a set of
octal latches (74ls245?) so that you can latch the data with (for example)
the READY line and read the lower 8 bits in with the (for example) strobe
line low and the upper 8 bits when the strobe line is high. This will give
you a resolution of 4096 and will cost maybe $20 outside the cost of the
encoder. I've bought numerous absolute encoders at hamfests for
under $5. Most any modern parallel card will do. I'm currently using
a pair of $14 Magitronics card to interface to a fuel injector tester
I built.

If that's too complicated, go to a foreign car junkyard and get the
crankshaft encoder (mounted on one head) from a wrecked Nissan
300ZX. This incremental encoder gives you one pulse per degree plus
another pulse at TDC. It is just-about-everything-proof and can be
interefaced to your computer with two bits of a parallel port. For more
resolution, simply gear it 2:1.

2058. Anyone used the JPS NF60 Notch?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 08:29:22 UTC
From: rrw@naucse.cse.nau.edu
Message-ID: <5104@naucse.cse.nau.edu>
Source record: 290077

73 has a review of the JPS NF-60 DSP Notch Filter in the
March, 92 edition. Bill Clarke WA4BLC likes it - a lot.
However, it's pretty expensive, so before I think about
buying it, I wonder if there is anyone here has used it
and may have some additional comments on it?

JPS also makes another unit (the 150?) and I'm wondering
about that also.

Having never used an auto notch design, I'm not sure if it
would help with my particular situation - I run mobile from
the car on HF bands (usually County Hunters) since I normally
travel quite a bit in the summer alone (helps keep me awake).
However I have two major problems - auto ignition/computer
noise and qrm (since I use a magnetic whip (ie, non directional
in the main)).

The noise ('88 Jeep Cherokee) is BAD! I even get it on the FM
radio. I've had a number of suggestions, but havn't really made
any real progress. Interestingly enough, it doesn't seem
to be IGNITION noise, but computer noise. If anyone has solved
this, I'd be really interested.

The QRM of course on 20 meters is also BAD! Which is the reason
I might be interested in an auto notch - since I'm driving, the
fewer adjustments I have to make the better (incidentally, with
all this talk about old radios - I use a Heath HW32A single
bander - probably 25 (?) years old - needless to say, tube
technology, but it works).

One thing I'm interested in is how a unit like this would handle
(if at all) varying ignition/computer noise - it changes pitch
as the engine speed changes (and also as the load changes - very
strange - the quietest is NOT when the vehicle is coasting, which
is what I would suspect, but when it is slightly accelerating).

Any suggestions greatly appreciated.

Please either e-mail or post

THANKS

Be patient with me folks, I'm excited and I need to brag a little. I did it! Passed my 20wpm last night, which means my Extra license is on the way. Finally!

But I couldn't have done it alone. I'd like to take a moment to thank all of you who have sent me encouragement, advice, suggestions, etc., over the last couple of months. Expecially:

Alan Brubaker, K6XO, for encouragement in the CW department and loads of antenna info.

Bart Jahnke up at ARRL HQ, for patiently explaining all the paperwork involved in multiple upgrades, and for all those postings of exam sessions.

The rest of the folks at ARRL, who put out the books, tapes, and W1AW code practice, that I learned from. Bart, would you pass along my thanks to everyone?

Everybody who posted on the "Stuck at 10wpm" thread a couple of months ago...I tried to take every suggestion to heart, and I guess it worked!

Everyone who sent me email (or posted) encouraging me and welcoming me to the Amateur ranks: young hi-tech folks and old pharts alike. You're a great bunch!

This kind of thing was common, too. After the FCC had issued all WA and WB calls in an area (this happened in 2, 4, and 6-land), and before they went to WD calls, they would issue new licensees currently unused WA and WB calls, in suffix order. If both the WA and WB calls with the same suffix were unused, they'd get issued together, and it was not uncommon for two folks in the same family to get the same suffix.

Yes, this is called "controlled carrier" modulation and showed up on a number of compact rigs at the end of the AM era. It drove hams with only fast AGC in their AM recievers crazy. The S meter bounced up and down with voice peaks, something they hadn't seen in AM signals. It looked suspiciously like the dreaded Donald Duck to them. When I had a TR4, I was accused of having poor carrier suppression by several SSB stations that I contacted in AM mode. :-)

A couple of AM broadcast manufacturers experimented with controlled carrier in the 60s, but the AGC pumping turned most broadcasters off. Modern receivers with selectable slow AGC would make it sound fine.

The Landwehr is an excellent unit, as are the products made by another German concern, SSB Electronics. ARR preamps, however, do offer the best noise figure for the dollar of any on the market. They are hot and tempermental, but used with care they produce excellent results. I lost a few units too before I learned how to tame them. They use unprotected GASFETs. That gives them an edge in performance, but does make them more vulnerable.

Their RF switched units haven't improved, to my knowledge, in the past three years. I don't approve of RF switched preamps in any event because they cause performance compromises that I won't tolerate. There's always an RF spike that gets through to the GASFET, and that will eventually destroy any GASFET with an unprotected gate. Yet GASFETs with unprotected gates offer better performance. No preamp manufacturer uses relays of the quality that I demand. None terminate their preamps when not in use.

There are better homebrew preamps than the ARR units, and I plan to experiment with some of those designs if I ever get time, but the ARR does the job for me now.

BTW, I don't approve of RF switched power amps either. They cause your exciter to look into an open circuit for a short time every time they key. With some of the tempermental exciters like the Kenwood 790A on the market, RF switched power amps can lead to premature exciter power module failure.

2064. Cellular on 900mhz Ham Band

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 14:10:25 UTC
From: DAUDET@TOROVM1.VNET.IBM.COM
Message-ID: <9205121410.AA17718@ucsd.edu>
Source record: 289980

Our Group did and experiment last fall with 2 cellular radio that was given to
us without the cpu control only the RF part of it (RX and TX). Our Technical
director made a small board with eprom to store the info to channelize the unit
and he did invert the PLL circuit the one from the RX unit to the TX and vice
versa. then he was able to get them to transmit on the Ham band between 908 and
928 . And the priliminary test showed that the bandwith is quite wide in excess
of 10khz from almost 20 to 20k on audio response . That all we did for now
as we stop that project to get the real 900mhz commercial radio we found
(Bundelman 3 complete Hop with 4 to 6' dish.) to complete our main route
for packet and voice repeaters. We will put a 3 Channels Multiplex system
to start with so we will use 1 channel for digital (packet) and 2 channels
for voice application. In future we also have 6 Gig microwave equipements
to put and extra 5 HOP with a 24 ch Mux system to expand the Network.
The 3 900mhz hop are covering from Quebec City to Chicoutimi for about
150 miles. The 6 GIG equipement will be used for local Hop around Quebec city
for the various Voice and Packet Application.
So feel free to ask for question and the Technical director or myself will
try to answer them.
For more info you can reply to my bitnet address or via Packet
VE2PNK at VE2SJC.PQ.CAN.NA or by mail to the Group Address.

>FM is better?
>
> Tony Lymer, GM0DHD.

Whoa! I never claimed that NBFM is a better extremely weak signal performer than SSB. But there are other factors here. ACSSB is seen as a replacement for conventional NBFM in the commercial arena. AGC, AFC, speech clarity and quality, suitability for use through repeater systems, ease of use by untrained operators, etc all come into play. ACSSB attempts to remedy the percieved deficits of SSB in these regards. It's low level pilot introduces problems of it's own however.

The tradeoff is not as straight forward as you make it sound. When signals are only moderately weak, FM can have an advantage through FM improvement. When there are multiple contending signals on a channel, FM capture ratio also comes into play. This can be seen either as an advantage or a disadvantage depending on whether you have the stronger or weaker signal on the channel. The difference need not be great. This allows frequency reuse on a shorter spacing than is possible with AM or SSB. See cellular phones for an example. When you are attempting to maximize the communications capacity of a given band of frequencies in a given geographical area, more factors than mere occupied signal bandwidth must be considered. See any text on spread spectrum.

> * Your estimate of the FM improvement is a little high. For a 5 KHz
>peak deviation signal up to 3 KHz it is 6.2 dB.
>I calculated the SSB S/N in a 4.5 KHz bandwidth but the speech part is only
>2.7 KHz wide so the SSB is actualy 2.7/4.5 or 2.2 dB better than 17.2 dB
>This gives an 18.2 dB S/N for the FM signal compared with 19.4 db for the SSB.
>But what is a db between friends!

You understand this, but I should clarify for others that there are two ratios that apply to FM signals. There is the carrier to noise ratio, abbreviated C/N, and there is the signal to noise ratio, abbreviated S/N. For AM and SSB the two figures are equivalent, but for FM there is a factor called FM improvement that allows better S/N ratios than the raw C/N ratio would indicate. The higher the modulation index, the greater the FM improvement. For the modest indexes used in NBFM, the improvement is only about fourfold, but that is significant.

Generally you are either communications quality, 12 db quieting or better, or you're gone in the noise. The window of vulnerabilty is only 6 db wide. That's attractive for relatively unsophisticated users who couldn't pull out a "weak one" like a ham DXer could anyway.

In your example, if you narrow the receive bandwidth to 2.7 kHz, you will lose the pilot carrier. If you intend to use two separate IF strips for the speech and pilot signals, that opens up another can of worms. Because the pilot has to be phase coherent with the RF speech waveforms in order to synthesize the carrier for speech recovery, you can't tolerate differential phase delays in your IFs. That's going to be a difficult design problem. AGC is going to become more complex as well with separate IF chains. It can be done, but the complexity is not likely worth the effort.

>How may dB correspond to one S unit?

6 db.

>Is there a uniform well defined standard?

Yeah, but nobody pays any attention to it. S9 is also *supposed* to represent 50 uV at the antenna connector, but aside from some old Collins military receivers, it never does. The only thing you can say with confidence about S meter readings on ham equipment is that S8 represents a stronger signal than S5. How much stronger or how it relates to an absolute value is anyone's guess.

Speaking of callsigns, am I the only one who finds the current system of keeping callsigns when you move to a different district absurd? What is the purpose of having districts if they no longer have any meaning beyond the initial issue? I can understand that people would be reluctant to give up a call, particularly when different calls have different "status", but I liked the old system much better: the only status was not having an "N" in your call (for novice), which was dropped when you got a higher license. Beyond that, the only things you could tell from a call were the district (very valuable if you were looking for someone, say, from 7-land), and a rough idea of how long the person had been licensed.

The start of the current system appears to have been when extras were guaranteed "K" and "W" calls when changing districts, back in the sixties.

For what it's worth, I have had four callsigns (KN0FLJ, K0FLJ, W5TLP, KY3B), and I really have no preference between them, except for dropping the "N" a long time ago.

2072. Good Experiences with Ramsey Kits? (packet modem)

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 15:52:45 UTC
From: btbg1194@uxa.cso.uiuc.edu
Message-ID: <1992May12.155245.3228@news.cso.uiuc.edu>
Source record: 289986

I am curious to hear about *good* experiences that others might have had with the Ramsey kit company. I bought their packet radio modem kit at Dayton and was very disappointed with it. I am hoping that my experience is unusual, because I think that we need kit companies around like Ramsey.

I paid ~$70 for the packet modem kit, which is steep when you realize that you are paying for a virtually public domain circuit using the TI (?) TCM3105 modem chip. And it is a 1200 baud modem after all, which you can buy for your PC for about $10 these days. (You can get the AEA PK88 for $140, and you can probably get AEA's PCB88 for significantly less than that.)

My main complaints with the Ramsey kit are these:

1) The kit claims to be ready to work with *any* VHF/UHF radio, HT, etc., but the manual does not even begin to describe how you should connect any radio other than the Ramsey radio kit to it.

2) I called Ramsey twice to ask for help with this. Both times, I got some aggressive sounding guys who seemed to think that *I* should figure out how to hook it up. When I told him that I was able to hook my HT up to a PK88 using the "standard" ICOM/Yaesu HT interface described in the PK88 manual, it didn't seem to make any difference. (Ramsey didn't even bother to describe how to connect an ICOM HT to their kit, which, according to one guy on the phone, is the *only* HT that they have actually tested it with.)

3) For $70 (with case) they don't bother to give you a socket for the expensive ($40?) TCM3105 modem chip.

4) There is no troubleshooting advice in the manual other than "double check your wiring and check for solder bridges" etc.

All in all, the Ramsey packet modem kit is very incomplete. I didn't mind scrounging around for a resistor that was missing from the kit, but I spent a week trying to figure out how to hook this up to my HT, and I never got the transmit section to work. (Receive did work.)

I also don't think that there is enough voltage coming out of the RS232 port on my Goldstar 386 machine to power their circuit, but I don't know how crucial this is for this circuit. Lest ye think I am incompetent at kit building, I should assure you that I soldered 3000 points on a supercomputer board last year, and *it* worked the first time.

Incompetent no, impatient yes. I would be happy to have paid the $140 for the AEA PK88 to begin with and then I would have a week of packet experience rather than a week of frustration under my belt now.

>enough loss at hf, especially if it's only 58 feet.

Sorry, this is incorrect reasoning. While it's certainly true that you
can't use a section of 50 ohm cable to match a non-50 ohm load *precisely*
to a 50 ohm source, the 50 ohm cable *will* act as an impedance transformer.
If your load presents the cable with a 3:1 mismatch, then the load impedance
is either 150 ohms, or 16.66 ohms. Now a quarterwave section of 50 ohm cable
will transform a 150 ohm impedance to 86.6 ohms. That's a much better match
to 50 ohms than 150 ohms. Sure the *cable* may have an SWR of 3:1, you're
counting on that because a cable with unity SWR *isn't a transformer*.
Cable losses due to SWR are miniscule at HF. All you really care about
is presenting the transmitter with a load impedance it can handle.
As far as the transmitter is concerned, it's looking at a load of
86.6 ohms. Even solid state rigs can deal with that.

>Now if you're using the LOSS of the cable to accomplish the match

>73, k9cun

The G5RV uses several tricks to present a reasonable load impedance to
the transmitter. The 300 ohm ribbon line section acts as a transformer
from the *non-resonant* flattop to a 4:1 balun that is connected to the
coax. The coax further acts as a transformer to the transmitter. The
flattop is never a 300 ohm load in the ham bands so the ribbon always
has some value of SWR on it that allows it to behave as a transformer.
The balun steps the resulting impedance down four times and the coax

then transforms that even closer to 50 ohms. The combinations of lengths are chosen so that the resulting impedance presented to the transmitter approaches 50 ohms on all 5 major ham bands. It is never a perfect match, but it is "close enough" that the transmitter can work into it.

Remember, SWR is your friend. It can help you transform a nasty impedance into one more to your liking. Transmitters don't care about SWR on the cable. All they want is an impedance presented to their output terminals that they can handle.

|> km@cs.pitt.edu

As Ken writes, I too am somewhat put off by the current state of callsigns.

if you are a county hunter, trying to get your first, second, or third
WAS, or looking for a particular geographic location, it is a pain in
the vertical antenna to wait for every station you hear to give their
QTH before moving off frequency to find the one you're looking for.

when you move from one qth to another do you keep the same mailing address?
just because you liked the combination of digits and street name? try that
on the US Postal Service and see what you get.

i went from KN5FJZ to K5FJZ to K5FO (i went through the upgrade in early
70's when FCC allowed you to request call sign you wanted, but i didn't
specify and that's the one i got). If i move to another district, i will
take my chances and request another call for that area. of course, i
did like the change from the old call, since cw ops (old and new) had
trouble with the combination and that was before the proliferation of
keyboard keyers and computers. :-) :-) ;-)

i can understand the paperwork involved at the FCC and the fact that they
are overworked and understaffed. my dad died in 1972 and his call was
W5NNB. i see no problem in the FCC reissuing the call. i asked for it

but was told that only a memorial station owned and operated by a club could get it. thus, with the current state it will never be reissued anytime soon. what happens when all the W5's die? the only one's remaining active will be the club stations, like W5AC, etc. such a waste to let those calls that are available go unused when there is such a demand for 1x2's and 1x3's.

just my $0.02 worth. 73 and bcnu at HAMCOM '92,

>public record (if, for example, they are police repeaters, etc.)?

Yes it's a matter of public record in at least three places. First is the FCC database which you can consult on microfliche at any FCC field office. Second, if the tower is over 150 feet tall, it's in the FAA database and will show up on the local aeronautical chart. Third, the county tax and zoning office will have a record of the construction permit. In addition to all these, the FCC requires a transmitter identification card be permanently attached to all unattended transmitters in such a manner that the licensee of the equipment can be easily identified.

>that you can use 50 ohm cable to get *closer* to 50 ohms by taking
>advantage of transmission line transformer action. It doesn't sound
>reasonable at first, but that 3:1 SWR makes it possible.

Sorry about that. In that case, you are just wrong.
The 50 ohm cable doesn't improve the SWR.

The quarter wavelength of 50 ohm cable transforms the 150
ohms to 16.67 ohms, maintaining the 3:1 SWR, as opposed to your
claim that it transformed it to 86.6 ohms.

There appear to be two different forms of G5RV antennas. The
classic one developed by G5RV himself that requires a transmatch
and those sold by dealers, apparently with modifications. The
latter is sometimes sold with claims that no transmatch is required.
Many designers do not appreciate "improved" designs being attributed
to them.

Verifying whether or not a transmatch is required is actually quite
difficult, since objects within a half wavelength of an antenna can
dramatically affect its impedance. It is not unusual for an amateur
to move an antenna like the G5RV and find that the antenna tunes
quite differently, even if its at the same height, due to the effect
of nearby objects.

2079. Alinco 580 questions

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 16:30:01 UTC
From: dsiler@col.hp.com
Message-ID: <1992May12.163001.2866@col.hp.com>
Source record: 289990

I have a couple of quick questions about the Alinco DJ580T. First, is there any way to determine the current battery charge level? The "FULL" indicator on the signal strength meter begins to flash when the battery drops to 6.2 volts --- other than that is there some way to see the current level?

Second, in a possibly related question what does it mean when BOTH tone frequency decimal points are illuminated? While scanning, sometimes the leftmost point will flash and the rightmost one will be on continuously. After awhile the rightmost point will go out again. Any possible explanations?

Thanks,
Dan N7WBG

DERRY@ROSEVC.Rose-Hulman.EDU writes:
> I often hear the statement that the 58-foot length of RG-58 coax is
> a "matching section". When will we get the notion out of our
> collective heads...

What 58-foot length of RG58? A G5RV for 80-10 meters is a 106 foot flat top center fed with 34 feet of 450 ohm ladder line. The end of the ladder line is then fed directly with any length of 52 ohm coax; contrary to common belief, no balun or other matching device is needed between the coax and ladder line (ref: Lou Varny, G5RV, in his article on his antenna in the ARRL Antenna Compendium, first edition). It is the 450 ohm ladder line that is often called the matching section. Some manufacturers who market antennas they call G5RVs (but which are not actually of that design) include a matching device at the end of the ladder line, with a length of coax attached; this may be the "58 foot length" you referred to. This is not part of the G5RV design; I suspect it is just a way for the manufacturer to justify a preposterous price for an antenna you can easily assemble yourself from a few bucks worth of Radio Shack parts. I put my G5RV up as a 'temporary' measure 5 years ago; It worked so well that I just kept right on using it: 120 countries in less than a year on 100 watts. Nothing to write home about, but not bad for a wire antenna I built for less than $10.

Craig Capell writes:
> I recently purchased a Heathkit SB-100 transceiver without a manual.
> Was this a decent rig?

This was a middle-of-the-road Heathkit; not the top of the line, but not the bottom, either. For their vintage, they were ok rigs, although I always found that they lacked sensitivity on the higher bands. I don't think they had a notch filter or passband tuning, so you might want to add an audio filter to help with selectivity, especially if your rig doesn't have the CW filter; it was an option. If it's clean, works ok, and you didn't pay much more than about $150 for it, it should serve you well as a simple, no-features rig. Most old Heathkits benefit greatly from a careful re-alignment, and new tubes, especially the receiver front-end. You should contact Heath service to see if you can get the manual for it. It not, ask around on the net, or at hamfests for a copy. There is a company called Hi Manuals that sells copies of manuals for old rigs. They advertise in the ham magazines. Good luck.

I am trying to determine if a correction ever appeared to an article that appeared in Popular Electronics in April of 1982. The article is "Build a Synchronous Detector For AM Radio" by Dave Hershberger, W9GR. Does anyone know if a correction was ever published - probably in July of 1982?

Any information or help that anyone might be able to provide would be greatly appreciated. (Popular Electronics has changed hands and no longer appears to have information pertaining to the older back issues.) If anyone else might have Popular Electronics going back to '82 - thanks in advance.

Very 73,
Mike Gruber, WA1SVF .

>they'd get issued together, and it was not uncommon for two folks in the same
>family to get the same suffix.

My original call, WA6ZGB, was issued in 1977, right as the first WD calls
were being issued. Since I had taken the Novice test as part of a group,
a bunch of us were issued calls all at once. I was issued WA6ZGB; WB6ZGB
happened to live a few miles away, WB6ZGC a few miles in the other direction.
Also issued in the group were WA6ZFX, WA6ZFY and WA6ZFZ, etc.

I finally let the WA call go in hopes of getting a shorter 2x2 a couple
of years ago; I ended up with KK6JQ, which is slightly longer on CW than
WA6ZGB!

There's also the story I related before about one ham radio vigilante
arriving at my door one night, demanding to speak to Mark Kupper (who was
WB6ZGB) because WB6ZGC was using language the vigilante didn't like.
That's right: this buffoon heard "WB6ZGC", looked it up in the callbook,
wrote down the name for WB6ZGB and the address for WA6ZGB. It took my
Mom ten minutes to convince him he was mistaken; I wasn't home, nor
was I anywhere near a radio.

DERRY@ROSEVC.Rose-Hulman.EDU:

>How may dB correspond to one S unit?

>Is there a uniform well defined standard?

>tnx es 73 de k9cun (Jack Derry)

Contrary to popular belief, there is no standard for S-unit size. Here's why: The S-meter generally simply measures a receiver's AGC voltage. To make an S-meter have a consistent number of dB per S-unit would require an AGC characteristic which is purely logarithmic over a wide range. This isn't otherwise required for proper receiver operation, and requires considerable effort to accomplish, so manufacturers of amateur equipment don't have any incentive to do so. That is, it costs money to implement and doesn't sell rigs, so it isn't done. (I'm told but haven't verified that the old Collins rigs had not only a consistently sized S-unit, but a calibrated signal strength for S9. Neither of these is so for modern rigs.)

I frequently give talks on antennas at local clubs and conventions. As part of the talk, I take a "vote" on how many dB in an S-unit. The results are pretty consistent, with a peak at 6 dB and a smaller peak at 3. After taking the vote, I show the measured S-meter response of my home "appliance", an Icom IC-730, on 40 meters without the preamp. The S-units on this receiver vary from 1.3 to 4.0 dB depending on the place on the scale, and the "10 dB" increments above S9 range from 5.6 to 13.5 dB. I always cringe when a writer sees a 2 S-unit difference between antennas and concludes that the difference is 12 dB or some similar ridiculous amount, when the real difference may be less than 3 dB. What the hell, only off by 9 dB! (The antenna would have to be about 8 TIMES larger to make up the difference.)

Not only is the S-unit size liable to vary over the scale, but also with band and whether a preamp or attenuator is switched in. Incidentally, the sensitiviy of my Icom scale isn't even monotonic -- it goes up and down as you go up the scale.

Measure your own S-meter. It's simple. A completely adequate step attenuator can be built in an evening with slide switches, 5% resistors, and unetched double-sided PC board. See the ARRL Handbook or Antenna Book for details. The only other thing needed is a strong constant signal. With the attenuator you'll also be able to dazzle your friends by actually being able to MEASURE RELATIVE ANTENNA GAIN! You need two antennas for comparison. Put the attenuator in series with the better antenna, and arrange a simple slide or toggle switch to switch between the antennas. While listening to a signal, switch between antennas and set the attenuator until they give

equal readings on your S-meter. The attenuator setting is the relative gain. In dB, NOT S-units! You'll probably find that the gain varies considerably depending on the direction the signal is coming from, the elevation arrival angle, with the fading cycle when fading is present, and perhaps with seasonal ground conductivity changes.

Please, please don't quote gains in S-units. Gain in "potatoes" would be as meaningful and less misleading.

I've had similar problems running SuperMorse on an HP95LX palmtop computer.
The dot/dash timing got messed up (the speed would start out ok, but over the
space of a few characters the speed would increase drastically, then fall
back again. I tried version 2.13 and it worked fine. Version 3.09 worked
ok too, though I decided to stick with 2.13.

Actually, on the 95LX, they only ran fine to the extent that you had to run
on AC power for them to work. The HP goes into a "light sleep" mode between
keystrokes to conserve battery power, and that was messing SuperMorse up.
I found a utility on CompuServe called HP95CTRL that allows you to disable
light-sleep mode. SuperMorse ran fine on batteries after that.

Some might be interested to know that I learned morse code entirely on my 95LX
(which is about the size of a checkbook, but 1" thick) and I'm even using it
to take my code tests at the VE exams. A little over two weeks ago, only 10
days after I started learning the first characters, I passed the 5wpm code
test and only missed the 13wpm by one question (fill-in-the-blank test).

Today, less than 30 days since I started learning code, I'm practicing at
20wpm and with any luck I should be able to pass the 20wpm code test at
the next VE session (plus the 2 remaining written tests). I never learned
to copy on paper, and the few times I've tried it I was a miserable
failure. Even on the tiny keys of the HP95LX, it's much faster for me to
press a key than to write on paper. I suspect it would be even easier if
I owned a laptop with a real keyboard (I'm a pretty good touch-typist).
Copying on a computer also makes it easier to go back and correct mistakes
at the end of the test (by copying from the HP to paper, you can fill in a

lot of missed characters and correct mistakes).

On a somewhat related note, I wish that SuperMorse had a few modes that were more geared towards taking the test on a computer. The only mode I find useful right now is "solid copy" mode. It will send a sequence of random characters while you type them on the keyboard. The sending rate is independent of the rate you type the characters in, which lets you fall behind and then catch up, or lag behind by a character or so. The problem is that the test exits as soon as you miss a single character. Another problem is that the test consists of random characters, with no option to use english text or QSO's, etc. There is a mode which lets you take a QSO style test, but doesn't allow you to copy on the keyboard. There is yet another mode which doesn't stop when you miss a character, but waits after every character for you to type it in and keeps re-sending missed characters instead of moving on to the next one.

Hi. I'm about to purchase a dual band handheld transceiver
(2 meter/70cm.) For $400 I can get the Yaesu FT-470, Kenwood TH-77A,
Icom IC-24AT, or the Alinco DJ-580. A nice guy from Ham Radio
Outlet raves about the Alinco. Does anyone have any advice which
is best? Thanks.

>David Kirkby G8WRB.

I offer a do-it-all EME/satellite/Sun/Planets/celestial noise/cold sky
tracking program that works in real time and will control your az-el
antenna through any of several A/D boards. It's called RealTrak (v. 8.2)
and also features CW transmission, dumb ASCII terminal, Y-factor
and EME link calculator, two full-color maps, and EME database lookup
(2m and 70 cm). Lastly, it's very easy to learn and use.
It works under DOS, with or w/o a coprocessor. RealTrak's main potential
drawback is that it's not free; cost is $50 US (or the equivalent in
sterling). Fully-functional, date-limited demo disk $2.

It looks like as long as there is no financial incentive, the FCC will probably never re-issue them. But if they could charge $25 -- $50 they would probably sell like the proverbial hotcakes..

Here in PA they started including an order form for personalized "vanity" license plates in with registration renewal. $25 for up to 7 letters/numbers. You see them ALL OVER THE PLACE now. People want them. People are willing to pay for them. The DMV supplies them. Why can't the FCC figure that out?

>you can probably get AEA's PCB88 for significantly less than that.)
>

I think that Ramsey's kits are overpriced:
- Consider their 2m transceiver kit. It cost $175 with case. Compare
this to Dayton price of Alinco Data Radio DR1200 for $230. The Alinco
comes with a with a display and easily tunable synthesizer whereas the
Ramsey kit does not. It puts out 25 watts as opposed to 6 w from the Ramsey.
- Consider their QRP 20m kits: Dayton price of $75. I priced the components,
at under $5 for the receiver and the transmitter. I understand that
I pay for it being a kit etc. But 600% markup? You say that they
should be compensated for design? Hah! The receiver is the Neophyte
receiver that appeared in QST and the transmitter is a butchered version
of W7ZOI's Universal QRP transmitter with the tuned coupling between stages
replaced by rc coupling. My guess is that they did this to save themselves
a dollar to two on the cost of toroid inductors. A friend of mine built
one and is having a devil of a time getting rid of parasitics.
- As far as learning value is concerned, they are absolutely mute about it
in their documentation. If there is value to learning then it is just
about convered by the risk of buying something that may not work.

I think that they have overpriced themselves out of a good thing.

>My main complaints with the Ramsey kit are these:

> according to one guy on the phone, is the *only* HT that they
> have actually tested it with.)

My experience on the phone with Ramsey has been mixed but better than that
you report above. They seem willing to help but do not get it right.
I started on a 2m FM Transceiver kit a couple of months ago.
I inventoried the parts before starting and did not find a packet
containing `rf critical capacitors'. So I called Ramsey and 10 days
later received a packet. With much anticipation I opened the
packet to find only a 1/4 of requested parts and a lot of
parts never requested. So I called again and finally got most
of the parts after another delay of 10 days.

> 3) For $70 (with case) they don't bother to give you a socket for
> the expensive ($40?) TCM3105 modem chip.

This is what I like about kits from TAPR. They include all the sockets.

>
> 4) There is no troubleshooting advice in the manual other than
> "double check your wiring and check for solder bridges" etc.
>
You can say that again. Their tune up instructions for the 2m tranceiver
are a bad joke. After some tweaking of inductors, I finally got 6.5
watts out. I haven't succeeded with the receiver yet. It is quite deaf
and I suspect the first mixer. I called them today and they said that
upon receipt of the failed part they will mail a new one out. Thats not
bad.

>to match to 50 Ohms. If the swr is 3-to-1 at one end of the line,
>it will be 3:1 at the other of the line is low loss. RG58 has low
>enough loss at hf, especially if it's only 58 feet.

In actuality, it is the ladder-line section that is the matching section.
The G5RV was designed to be mostly a 20-meter antenna. On this band, it
will operate without an antenna tuner. On other bands, it main claim to
fame is that the mismatch is fairly low, resulting in an SWR of about
4:1. At 4:1, on HF, the additional loss on a piece of coax is still
accpetably low, resulting in a low-loss antenna *system* when an antenna
tuner is used to tame it down.

>Personally, if you're running any lowloss ladder line at all, run it
>all the way to the shack and forget the coax.

The only possible problem with doing this is the limitations in the
matching range (vs loss) of the balanced output of the antenna tuner.
Most of these tuners use a ferrite balun. Now, a balun works pretty
well around its design impedance, say 50:200 ohms. If the impedances
range significantly far from that the balun might not be functioning well
any longer. The actual impedance at the end of a random length of
open-wire feeder feeding a dipole may range from a few ohms to a few
thousand ohms. THe balun may not work well.

Of course, any RF lost due to a poor balun or antenna tuner will be lost
as heat. If the balun and tuner are "cool" then the system is working
reasonably well. Anyone who has ever grabbed ahold of a 10-watt
resistor knows that even 10 watts can generate a lot of heat. So if you
are running 100 watts at 90% efficiency, you will probably be able to
tell. 100 watts at 50% efficiency would only be down about 1/2 S-unit
from full power -- not ideal but equivalent to running 50 watts.

An article by G5RV appeared in the ARRL Antenna Compendium volume I --
now out of print. I will supply a copy for an SASE. Make sure to tell
me what the SASE is for! I get letters that simply say "Send it." :-).

> the RF section.

It's been over ten years since I was launching these, but you're probably right. The Viz sondes we used on Cambell Island were supplied by the US, and I _think_ they were around 407MHz. The frequency could be varied quite a bit - useful if a first release gets stuck in antenna wires :-)

Most sondes contain an aneroid barometer which moves a wiper-arm on a printed-circuit. As the sonde ascends, the arm moves across the circuit. This switches the various elements in sequence: temperature, humidity, and reference. The carrier is modulated by these.

Provided you're nowhere near an office that releases balloons, there should be no danger in firing it up briefly to determine the frequency (although it's bound to be illegal :-)). Why not contact the National Weather Service? They've probably got some info about them.

2100. ICOM 730

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 19:30:56 UTC
From: cfishman@pica.army.mil
Message-ID: <9205121523.aa00448@FSAC1.PICA.ARMY.MIL>
Source record: 290011

The 730 sure does work on the WARC bands. I think one wire has to be circumsized to enable them. I have had a 730 for about 6 years and have no complaints about receiver sensitivity. I have purchased Hewlett Packard PIN diodes an intend to replace the switching diodes used in the receiver front end to hopefully improve the third order intermodulation products there.

All in all , the 730 is a reasonable radio with a great tuning rate and a decent first mixer in the front end. I have the ICOM super duper (too damn expensive) 455khz sideband filter in my radio and it is a noticable impovement over the standard filter.

Too bad it does'nt have 160.....thats way the 735 was born..

|
Gary, tell us about this one! I didn't know about this 'mod'. Even
though I removed the input attenuator of my MM432, the drive still seems a
bit low (I get more output on FM than on CW, so I assume that I am still
underdriving on CW and SSB. I forget the exact measurments that I made, but
I would still like a little more drive from my '735 transverter jack.

>
> Gary KE4ZV

By the way, I wonder if the differences of opinions (and measurements) about the '735s transverter output could be due to a difference in the load (or impeadance) that is connected to the jack during the measurement. If I remember correctly (very vaguely at this time), the ICOM specs a fairly low output level, but into a 50 ohm load. I think it was 30 mv into 50 ohms (which happened to be the input impeadance of my transverter before the input attenuator was removed).

Lets see... where's my calculator.....

30mv across 50 ohms is (E/R=I, 0.03/50=0.0006 amps) 600ua

30mv * 600ua = (E*I=P, 0.03*0.0006=0.000018 watts) 18uw

(yes, I tend to do things out the 'long' way)

18 micro watts (18uw, 0.000018 watts) is a lot lower than the 100 milliwatts (100mw, 0.1 watt) that most popular transverters (well, at least the ones that I have looked at) specify as a minimum amount of input power.

Has anyone had any luck in using the transverter jack as a tranceive jack? By looking at the schematics, it appears that the transverter jack will INPUT RX energy here when the '735 is in the receive mode. I have tried this, and it does work, but the normal RF in/out jack (the SO-239 antenna connection) is still 'hot' during receive. I also get better results connecting the transverter downconverted output to the SO-239 connector than to the transverter jack during receive. I assume this is dependant on the RX output level of the particular transverter that I am using (again, an MM432-28S). By using the SO-239 connector, I can still use the '735s input attenuator and pre-amp (they are bypassed by the transvertor jack input).

I still plan on using the separate RX input jack of the '735 for the transverter RX output, but I have not built the relay that I need to allow automatic switching in and out of the transverter yet.... Luckily I have not blown up my transverter by transmitting 100 watts of HF energy into it..... That reminds me, I think I better put that project back on the TOP of my 'TO DO' list, before I have to repair that transverter!!!

Again, Gary, please post or email the coupling capacitor change that you mentioned, and please describe how it affects the transverter jack input and output levels (or what ever else it affects).

Rich

>

Hi Kaj:

That is great news. The story on the HDLC and KISS cannot possibly be right.
I agree that they are pigs and use a lot of ticks, but they cannot consume more
total ticks than the 9600 bps modem. You might mean that their processing can
be deferred since they are the foreground task and that while they are running
they use most of the processor ticks but it should be clear that for most of
the time they are sitting idle waiting for the `HDLC has arrived' flag to go
up and then KISS only gets executed when HDLC says it received a valid frame.
The 9600 bps modem must be executed each and every sample time and can be deferred
only with great difficulty.

I am sorry I did not know about your equalizer modem.

Congratulations.

Bob

2103. Re: FIELD STRENGTH (S METER)

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 20:14:39 UTC
From: brian@ucsd.edu
Message-ID: <up8vfINNbuk@network.ucsd.edu>
Source record: 290014

Back about 20 years ago, when I was servicing ham equipment, there was a standard - 6db per S unit, with S9 = 50 uV. This was called out in nearly all the calibration manuals, especially the Collins gear we worked on. There were a pair of pots in the radio for setting this, and as I recall, the Collins S-meter tracked our signal generator rather well.

My TS-440 comes close, in AM and SSB modes. In FM, it's imaginary.

2104. Anyone tried Alinco 560T or 580T?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-12 20:40:55 UTC
From: mjr@netcom.com
Message-ID: <k+mkq#p.mjr@netcom.com>
Source record: 290018

While waiting for my license to arrive, I've been considering various VHF rigs. I'm leaning towards the new Alinco 580T HT. It supercedes the 560T having all of its features plus a few more like CTCSS encoding built in, etc. Has any one tried either of these radios? I'm particularly curious about how they handle intermod interference. I'm told that this is a problem with dual band HTs, especially those with wide receive capabilities (the 580 has it, the 560 does not). Any pointers would be appreciated...

Hi Mark,

That sounds just like my situation in January. (My novice license
expired in 1976.) I just got my "Technician Plus" (meaning with the 5
WPM code) 2 months ago.

I suggest getting the No-code Technician license. You can always learn
the code later to upgrade your license.

The No-code Technician license will give you access to the 6, 2, 1.25
meter bands and up. The No-code Technician license will NOT give you
access to the HF bands (80 meter - 10 meter) that you had as a novice
(Some international law requires at least 5 WPM code for that).

The "Now You're Talking" book from the ARRL (American Radio Relay
League) has everything you need to pass the No-code Technician test.
The book (minus the vendor ads) is supposed to be available through
Radio Shack (and is pictured in their catalog) but it seems to be out of
stock alot. The test is administered by local volumteer hams in your
area. Look for ham antennas and ask around.

(I'm not pushing, but these days there are some great morse code
teaching computer programs available, like SuperMorse for the IBM PC
compatibles.)

I couldn't find your old call (WD0EJT) in a call database, but I don't think you can re-instate it either, especially without passing a test.

I don't claim to be an expert, but email me if you have questions.

>>10 bits resolution per/rev with "perfect" linearity. The original
>>request was for something with an analog output so it could talk to
>>the A/D board that I already have.

If you have an incremental (quadrature) encoder with "raw" undigitized outputs, you can interpolate between the transitions you would get if the signals were digitized. By assuming the two channels represent sinusoids (which depending on your sensor, can be pretty close), you treat what would be 4 counts as a unit circle with one channel being sine and the other cosine. Then a quick arctangent. This gives from 20 to 100 times the resolution.

The accuracy however depends on how well you can compsensate for what the encoder puts out. But 10 times the encoder resolution is pretty easy.

>"overdrive" involved.
>
>Amateur radios are rated for ICAS service.
>

The consideration 'a 100 watt SSB radio should only produce 25 watts AM' is
only true if you are talking about linear amplification. If you are able
to optimise the operating conditions of the output stages, then you can get
lots more! Usually SSB 'linear' PA stages operate in class A or B.
Typically this means you are limited to efficiencies of about 50%; the rest
going in heat. 'Traditional' AM transmitters use the PA in class C and
anode- or collector-modulate. You can get higher efficiency (70%) this way;
also, the power in the sidebands is supplied from the modulator, rather
than by varying the efficiency of the PA itself.
Trick modulation-methods (grid modulation) work by varying the efficiency
of the output device; they are inefficient and hard to get anywhere near
100% modulation without distortion. Their only merits are low cost and
simplicity.
I always used to design on the basis of CCS ratings rather than ICAS, but
that was because i used to be into RTTY and SSTV which are not exactly
transmitter-friendly.

Source record: 290022

I'm sorry to repeat this, but I realised that I didn't include my e-mail address the previous time, making it impossible for anyone to caontact me directly.

I've recently purchased a number of large valves that are made either by RCA or ITT. The RCA ones are marked:

RCA
JAN
DOD006
26720
80-20

The ITT ones are marked

ITT
DOD-006
7724
20948

The supplier told me the RCA ones are the RCA 7213 and the others similar, but I would like it confirmed if this is true.

The valves are of a coaxial construction and look designed for UHF. I have data on the RCA 7213 which is briefly:

3kV @ 1A HT
700V screen
1500W anode dissipation
1100W output at 600MHz
Frequency of maximum ratings 1215MHz.

Does anyone know of the DOD-006 (which is marked on both the RCA and ITT tubes)?

If he is a real :-) ham, suggest he work WITH you to resolve the problem. If he has been licensed for a long while, there is a good chance he knows exactly what to do on both ends to reduce the interference. This is not to say that the newly licensed hams don't know, but most of them haven't been exposed to this type of problem.

Good luck to you in any case.

From: mikey@slic.cts.com
Message-ID: <6J4okB2w165w@slic.cts.com>
Source record: 289942

Anyone ever heard of the Kreco Antenna? Manufactured by the Herb Kreckman Company, Cresco, PA.

I've heard that these antennas make excellent VHF moutaintop repeater antennas.

I have a need to replace the Hustler G-7 on the hill. The weather conditions on the mountain are too severe for the Hustler series.

The Kreckman came highly recommended for severe conditions. The cost of the antenna for 220 Mhz is $135, about the same as the G-7. However, the Kreckman sports a gain of 5.8 to 6.0 Dbi while the G-7 is 7 Dbi.

Looking for satisfied owners but unhappy customers are welcome too.

Thanks in advance, --Mike

Yes this is typical of Cherokees and Cheyennes. The computer box
is just to the right of the steering column under the driver's
side dash. Ground that sucker properly and use torroids on it's
leads.

A note about grounding on these vehicles. Jeep didn't do it, so it's
up to you to establish good grounds between the various parts of the
vehicle. If the light in the car radio dims in time with the turn
signals, or the headlights dim when the air conditioner kicks in,
you've got a typical Cherokee. Ground, ground, ground, and all your
troubles will disappear. My Cheyenne's horn wouldn't even work from
the factory. The "ground" connection was fully painted. Yuck!

2121. Re: Can they get in big trouble for this?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 06:59:50 UTC
From: brian@ucsd.edu
Message-ID: <uqep6INNo5v@network.ucsd.edu>
Source record: 289934

Seems to me a brief note to the construction company explaining the problem and what might happen to them if they're caught might well cause the construction company to go pound on the communications company that sold them the ham rigs in the first place, thus solving the problem much more directly and, considering the rate at which government agencies work, much more quickly. Of course your original letter indicates Cc: to the FCC, but you don't need to mail that right away.

On the other hand, your letter might not do any good at all. If you don't think it has after a week or four, you just send the carbon copy of the letter to the FCC.

Worst case, you're out an additional 50c for stamp, envelope, and CC of the letter. Not a bad investment. And it might well avoid involving the government, which is probably a good thing. Keeps the thickness of your FBI and FCC files down too, which will also be a good thing when the next Joe McCarthy gets elected.

2123. Regarding ACSSB and Spread Spectrum

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 11:06:52 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9205140106.AA05451@cmr.ncsl.nist.gov>
Source record: 289883

Gary counters the ACSSB vs. NBFM thread with a suggestion that Spread Spectrum with code division to separate the station would be better.

I won't attack that premise, but I do worry that SS stations will be REALLY broad and ruin the chances for conventional weak signal work on other parts of the same band. Just how far down would we expect an AMATEUR SS station to be 1 - 5 - 10 MHz away from its "carrier" frequency - given the normal imperfections in ham techniques?

Any good, quick answers? Sure, I know it depends on the characteristics of the SS signal, suggest some likely ham values, please.

73, Bob W3OTC

2124. Re: Problem w/ address from List of Hams on Internet

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 12:01:15 UTC
From: bill@falcon.cs.uofs.edu
Message-ID: <10705@platypus.uofs.uofs.edu>
Source record: 289940

Not only that, but I can't begin to figure out the method he uses to
extract these addresses. My messages contain both a valid From: line
and a valid Reply-To: line yet I show up in his list with a bogus address
somehow extracted from the Path: line. Being as we are not a UUCP site,
the Path: line contains no usable information regarding mail to this site.

It seems like a nice idea, but I think it still needs a lot of work.

I took a chance and picked up a used MFJ-752C "Signal Enhancer II" audio filter ("it works fine!") without a manual at Dayton a few weeks ago. I figured what the heck, hooking it up doesn't exactly take a rocket scientist (to coin a phrase)...

Well, as luck would have it, the guy fried a resistor (overdriving the speaker? RF in the shack?) in the %%@%@#%ed thing, and so now I really DO need the manual, or at least the schematic.

Anyone have a photocopy I can beg or buy?

I recently got a copy of a catalog from a scanner sales company and noticed that they were offering VHF radios that had one or two frequencies in them that they referred to "itinerant frequencies". I believe that they were in the 151.xxx Mhz range. They went on to say that one needed to be licensed to use these frequencies, but an application came with the radio.

I have never heard of this, and was curious if anyone on the net could explain this. Are there analagous frequencies in the 450-470 Mhz range? Or anywhere else?

Thanks for the input.

^^^^^^^^^^^^

The 560 also has wide receive/transmit capabilities. The difference is that the 560 does not receive AM Air band or 800 Mhz stuff. The 2 meter and 440 bands should be about the same as the 580. I won the 560 and am very happy with it. It is VERY sensitive but as you say, is prone to intermod. I would guess that it is comparable to the 580 as far as that goes. I hear that the 580 is a super radio and does indeed have some superior features. If you can get the 560 real cheap, you would probably do just fine with it. If you want the 800 Mhz and Air stuff and don't mind paying a little more, go with the 580.

Sure, but why bother? Most encoders seem to have digital (on-off) outputs, and (a) high-count incremental encoders are both common and cheap, (b) you can increase the count with an N:1 gear between antenna and encoder.

2133. Alinco DJ580T summary

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 15:03:24 UTC
From: dsiler@col.hp.com
Message-ID: <1992May13.150324.10392@col.hp.com>
Source record: 289949

Several people have sent me queries regarding my experiences with the Alinco DJ580T. I will try to summarize them here, and also have an electronic version of an improved manual compiled by Jay Appel (KA1SNA) which I can e-mail upon request (it is 131kb of text.)

I bought my DJ580T ($399 mail order) in April 1992 and am very happy with the unit. The main factors in my decision were:

1) Compact size in a durable package (stronger than some of the small ICOM's)
2) Ability to receive aircraft frequencies (110-138)
3) Dual band - 2m and 70cm
4) Sophisticated scanning features that can be easily used
5) Programmable memories
6) Lighted keypad
7) Good reputation for quality
8) BONUS: good informal support in rec.amateur.radio.misc, e.g. user manual

The DJ580T met all these criteria with flying colors, and has more additional features than I will ever need. This makes it tops in my book for price/performance because it does not require an additional option for things such as sub-audible tone transmission (as does the IC-24AT.) There are a lot of features that can be tailored to individual preferences, including the memory channel allocation (default is 20 channels for each band.)

When I received the unit I was surprised that it did not come with any type of soft case. I will be ordering one shortly and wish that I would have included that item in my initial order. Other than that I am not aware of any "extras" I will need for the DJ580T, though options such as a spare battery and a quick charger are available.

I was also surprised to learn that in order to receive aircraft frequencies I need to be fairly close to the airport. At some point in time I will explore some antenna options that will probably resolve this issue.

One possible concern that has not bothered me much is the close proximity of the left most (2m) volume/squelch knobs to the rubber duck antenna. There is very little space between the antenna and knobs, which could become an issue when making large adjustments. Since the 70cm volume/squelch knobs have plenty of space around them and double as the unit power-on switch, this has not been a problem for me.

The modifications for clipping the blue wire (extended transmit) and the red wire (extended receive) were relatively simple to perform. I can now receive 110-172 on the 2m band, which allows me to receive things such as the weather service on 162.xx and various police frequencies. Testing with

a friend proved that I can transmit on Marine Band, though I will not be using that feature much (especially since I just moved from Seattle to Colorado Springs!) I have some detailed experience and mod info from Dale Mosby (N7PEX) that I can e-mail upon request.

In summary the DJ580T packs a lot of powerful features into a small, durable package that employs many sensible defaults and is a pleasure to use.

73's,
Dan N7WBG

In rec.radio.amateur.misc, sharon@unixland.natick.ma.us (Sharon Machlis Gartenberg) writes:

>Yes, it's that call every ham dreads. ...

>"I've been hearing voices coming from my telephone line. Do you have any
>idea what it might be?"

>Sigh. I suppose I could have said, "Gee! What an odd problem! I hope you
>find the solution soon!" ... .

If you interfere with your own phones, you could say "It's been happening to me, too." :-).

>But she was so nice about it. Seems it's been happening for months, but she
>only got around to suspecting us recently (after calling NE Telephone out to
>check the line). I would have thought 3 antennas on the roof might have
>tipped her off sooner. ...

Sharon, send me your postal mail address. I will send you our RFI Package. It contains some good stuff to help with the neighbor -- a copy from the FCC Interference Handbook that clearly states that audio devices (including telephones) that pick up radio signals are improperly functioning as radio receivers. That should get you "off the hook" (groan). Not that you shouldn't offer help, but at least it will help put things into the proper perspective that you are helping her with HER problem. The RFI Package also has a discussion of the inter-personal aspects of EMI control and a brief description of "stock" EMI fixes. A consumer pamphlet and EMI Resources List (filters, EMI-proof phones, etc). The best part is that it is free, although we appreciate a large SASE and 98 cents to cover the postage. (It will encourage you to buy our Radio Frequency Interference book, but that is another story. :-))

>Well, I hope we can work something out with a filter, maybe a new phone
>set for her, or SOMETHING. I'd hate to have to feel guilty every time I
>key down my microphone. ... :-(

>But it seems we're also causing interference to her fax machine.

Filters and EMI proof phones can help IF the RF detection is taking place in the telephone (most likely). It can also be taking place in "diode" junctions in corroded wiring or in solid-state equipment of any sort (telephone-company owned, other telephones, answering machine, FAX machine, etc). If you missed my recent posting of the EMI Resource List, let me know -- I can email it.

As for the fax machine -- simplify the problem! Start with one telephone, get the bugs out, then add stuff back one at a time. If you are lucky, you will fix them all. If not, at least you can blame one piece of equipment. Also, the phone wiring forms a big antenna -- it sometimes takes more than one filter to break up the resonances and tame the problem. Filters can be used just like insulators in guy wires -- the high impedance breaks the resonance and makes the telephone wiring less efficient as an antenna.

>Thoughts/others' experiences welcome!

Contact your section Technical Coordinator via your Section Manager - see page 8 of QST. The TC can usually help a lot finding local help. Good luck, and if I can help in any way, you know where to find me. :-). 73, Ed.

2135. English Mast

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 15:12:29 UTC
From: rwilgus@pica.army.mil
Message-ID: <9205131110.aa23126@FSAC1.PICA.ARMY.MIL>
Source record: 289950

Hi:
I am trying to obtain some information on a telescoping mast that
was manufactured in England during the 50's for the NATO forces.
The mast was made in Jersey by Clark and is currently being distrubustributed
by Anchor Supply in England.
The mast is quite unique, it telescopes to 40ft and retracts to 7 ft 8 in.
The base diameter is approximately 8 inches in diameter and weighs about
200 lbs. It has four pods that are 6 ft long. The mast is raised to to 40 ft
by air pressure, requiring about 12 psi, which can be obtained by a bicycle
pump. The color of the mast is dark green and it takes about 5 minutes to
fully extent the mast to 40 ft. This mast can also be attached to a 20 ft
optional mast which will get you up to 60 ft. The top of the mast is capable
of holding an rotor and a tribander antenna.
This mast would be useful for field days and QTH's where there may be
height restrictions or whatever. The cost in England is about 300 lbs.
If anyone stateside or in Canada knows where this unique mast can be
purchased let me know via Info-Hams. I got the above information from
G4BCR, Terry in Prezance, England. He has one and is well pleased with
it.

Several people have asked me to summarize the results of my query yesterday about the Alinco 560T and 580T HT transceivers. The response was very good, 6 emails in less than 24 hours.

Overall, the response was overwhelmingly positive. By all accounts these (and especially the new 580T) are the best HTs on the market right now, especially when one considers price compared to Icom, Kenwood, Yaesu, etc. Two different respondents were so taken by the first 580T they bought that they immediately went out and got a second!

One respondent did note that there was some intermod interference, but implied that the Alinco did a better job handling this than others, or at least was as good as the state of the art seems to be on this problem right now. Personally I don't understand why manufacturers insist on adding wide-band receive to these devices when this feature seems to be at least 50% the culprit with respect to intermod. I already own a mobile scanner. I don't need wide-band receive, and would much rather the manufacturer put narrower filters in the unit to aid in intermod rejection. Too bad there isn't a standard option for this. Perhaps a modification...?

Be that as it may, however, the Alinco 580T seems to be a great product at a very fair price (399.95 most everywhere, I've called 5 HAM stores around the country including EBB, HRO, EGE, and HENRY). If anyone has anything to add, please feel free to write me...

Still awaiting license..

> I always thought the "SB" line was their top of the line in the
> mid/late-60's...

My recollection is a bit hazy, but it seems to me that the SB-102 had a permeability tuned oscillator, while the SB-100 has the usual variable capacitor type VFO. I had an HW-100 back in those days, and I remember comparing the two, and judging that the SB-100 wasn't worth the extra money.

A 12 foot dish isn't going to give you very much gain on 2 meters: about 13 dB gain, with about a 35 degree beamwidth (at the half-power points). At 70 cm, things are somewhat better: 22dB and 12 degrees, but you can still do as well or better with simple yagis, and not have to worry about putting extra feeds on your dish. What exactly are you doing?

In rec.radio.amateur.misc, saul@nsq.uucp ("Saul A. Juliao") writes:

Hi, I'm currently in the need of using my TVRO 12 foot
dish for receiving and transmitting on the HAM 2meter
and 70cm bands. I would also still like to use it for
TVRO purposes (not needed at the same time), but would
like to have all connections present to my LNBs..

Is it possible to transmit, lets say 70watts around
the LNBs without killing them or the TVRO receiver??

Do I have to remove the LNBs (C and KU) or can I leave
them there and have a helical coil around my feedhorn
as my transmitting and receiving point for HAM use?

Saul,
I had very good results using an 8' dish simultaneously on 435 and 1269 MHz.
This was to access mode L of one of the satellites several years ago.
I used two concentric helical feeds to do it. The two measured rather low
mutual coupling and full duplex worked very nicely. There was no overload
problem.

While I think that getting all the C band hardware inside a 1200 MHz
helical feed could be pretty difficult, I think you stand a good chance
of being able to do it at 430 and certainly on 2M.

For the .375 F/D dish I used, only a 2-3 turn helix was
necessary to properly illuminate the dish. Remember to wind the helix
in polarity opposite from what you want to radiate since it gets
reversed upon reflection from the dish's surface; LHC <-> RHC.

I don't think you should have any problem with lower frequency energy
making its way into the C band feed. It should be a very good
waveguide-beyond-cutoff attenuator for vhf and low uhf.

I suspect with a little mounting ingenuity that you could transmit on
the hambands at the same time you are using the C band receiver.
However it probably wouldn't be too useful unless the satellite you are
working through happens to be pretty close to a geostationary C band one
you want to receive.

Zack, you are right. Somewhere in my files I have a letter from G5RV indicating that the balun that is often used in G5RV-type antennas is not part of his design. A now-defunct company was making some pretty wild claims for a G5RV-with-balun antenna. I forget whether Varney called them poppycock, hogwash or hooey, but his exact words were pretty close. :-).

I just looked. It was "hogwash." :-).

2144. Handheld Battery Charger/Amplifier

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 18:20:33 UTC
From: daveb@SSD.intel.com
Message-ID: <1992May13.182033.447@SSD.intel.com>
Source record: 289961

Me and my friends have a number of handhelds that we'd like to charge in our vehicles... (mostly Alinco 580s) and we'd like to do this without buying the $100 Alinco charger (with cig lighter adapter). As an added benefit, we'd like to run a "dualband" 20watt linear amp too.

I'm assuming from all of the net chatter about dualband handhelds, others would be interested in this also.

Requirements:
- 12 vdc source input
- rapid charge with sensing to avoid overcharge
- secure holder for radio (vehicle bounces around alot)

What we'd really like is the old Motorola convertacom setup, but none of the ham handhelds I've seen are set up for that (with contacts on the base).

We've heard the Alinco charger is very similar to the better icom charger, in that it truly senses the battery's level (rather than a thermocouple switch in the battery case). A quick examination of the inside reveals a fairly extensive amount of logic (for a charger!). Presumably this includes sensing circuitry and a regulator chip.

Here's what we're wondering:
1. is there a competitive product available at a lower price?

2. has anyone built their own?

3. any idea who supplies the logic board to Alinco? (we could buy these boards in volume and build our own cases with transformer, etc etc)

4. anyone used/seen a linear that will work 144/440? The RF Concepts one looks like a good bet...

Please reply email directly. I'll summarize responses and post to the net.

A reminder to all that the American Radio Relay League
continues to make available to Amateur Radio Operators and
non-amateurs alike a wide variety of free materials and
services. Of particular interest to the not-yet-licensed
individual would be the ARRL Prospective Ham Package. In
the PHP, one would find:
.-
1. Printouts of Volunteer Examination session opportunities
in his/her area.
.-
2. Listings of Amateur Radio clubs in his location.
.-
3. Helpful promotional material about the Amateur Radio
Service.
.-
The already-licensed individual might well be interested in
another free ARRL publication, the ARRL Public Service
Communications Manual. The PSCM represents the "bible" of
public service communications, and clearly/concisely points
out how the ARRL National Traffic System and the ARRL
Amateur Radio Emergency Service function as a cohesive unit
to provide the maximum support to the public both in times
of disaster as well as "normal" times.
.-
To obtain either of these free ARRL services, please provide
me with:
.-
A. Your name
B. Your mailing address
C. A Specific request for either of the two services above.
.-
Best 73!
.-

Hi Sean,
Have you considered a DISCONE antenna? It has no gain, but is very wide band.
I beleive Radio Shack has one if you wanna check it out. I think they rate it
from 25-1300 Mhz. It's construction is a horizontal disk (which is "hot")
placed over a cone (ground). Some types have an additional loading coil and
vertical to bring up the low frequency response some. They do their job well,
the only drawback being that they are both omnidirectional and wideband,
meaning that along with the stuff you wanna hear, you may get interference from
the junk you don't want. (i.e. pager xmitters, tv and radio stations, etc...)
If you can put the antenna up high and feed it with a fat cable (like 9913 or
better) and don't have strong local sources of interference, the discone is
a good way to get reasonable performance. The alternatives get expensive!
The full tilt way to go it is to get rotatable beams for every band of interest
and a switcher. Numerous notch filters to cancel out interfering signals
wouldn't hurt either. While your at it, get a spectrum analyzer... :-)

If you really wanted to you could take the three or four antennas you mentioned
and do what you were saying, which might give you some gain (depending on the
antenna type) and run them to an antenna switch, which would reduce cross-band
interference, but I don't think it would be worth the extra money. Most of the

interference I run into with my scanner is in-band anyway.

It sounds to me like you want an all-band setup that allows you scan the whole works without computer control or manual switch flipping. In my humble opinion, the DISCONE is your best bet. The NSA swears by 'em....

2147. ARRL EMI/RFI Consumer Pamphlet available.

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 19:11:01 UTC
From: ehare%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <675@arrlhq.UUCP>
Source record: 289964

The newly created ARRL EMI/RFI Consumer Pamphlet is now available
from ARRL headquarters. This pamphlet is designed for an amateur's
non-technical neighbor. It discusses the inter-personal aspects of
EMI issues, responsibilities, causes, help, the Technical Coordinator,
finding help and a few basic cures, all from a neighbor's point of
view. (Pretty tough to cram all that on a 1-page, folded pamphlet,
but we did it!)

You can get it from headquarters in several different ways:

1. Send me email, asking for a copy of the EMI/RFI Consumer Pamphlet.
Make sure to include your postal mail address.

2. Send an SASE to the ARRL Technical Department Secretary, and ask for
the EMI/RFI Consumer Pamphlet.

3. It is also part of the large "RFI Tips" package, available from the
Technical Department Secretary. Large-size SASE and 98 cents postage is
appreciated. Her email address is bdicosim%arrlhq.UUCP@uhasun.hartford.edu .

4. Contact your ARRL Section Technical Coordinator (via the Section Manager -
see page 8 of any recent QST - for those who may have missed all my
recent postings. :-)) They don't have it quite yet, but I will send them all
a few copies early next week.

5. Multiple copies are available to SMs, TCs, TSs, local EMI/TVI committees,
amateur radio vendors, and the like -- essentially anyone who has a real
need. Give me a call or send me email describing why you need a bunch. We
only printed up 1000 for the first run, in case we need to make any more
changes.

If anyone wants any specific help or information about an EMI problem,
send me email or call me here at HQ. I can get the process started.

2148. Engine interference with aircraft radio

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 19:37:57 UTC
From: Charles.K.Scott@dartmouth.edu
Message-ID: <1992May13.193757.16406@dartvax.dartmouth.edu>
Source record: 289965

I posted this question in rec.aviation, or sci.aeronautics, I can't remember now, and didn't get much of a response. Someone did tell me to try posting the question here as there are many radio people reading this who might have some ideas about what's happening.

The problem is excessive interference in an Escort II aircraft navcom radio while the engine is running. I can tell you this much. The ignition harness is new and shielded. The radio installation was not done by a professional (me), but aviation wire was used throughout although it was not shielded. No effort was made to silence anything else, mostly because we didn't realise how big a problem it could be. The aircraft is a Waco UPF-7 with a Continental 7 cylinder radial (220 hp) and magneto ignition. If it makes any difference, the points in the magneto could very well be a little dirty. Electrical source is by generator with a mechanical regulator.

I can confirm that the radio seems to transmit and receive fine when the engine is stopped. Interference becomes worse and worse with increasing rpm until by the time we are at cruising speed, transmission and reception are pretty well garbled.

Is there such a thing as a silencing kit? Do capaciters quiet noise? What size, where should they be placed?

Any help anyone can give will be gratefully accepted.

Thanks for the help in advance, Corky Scott, willing aviation lackey.

The Heath SB100/101 transceivers, SB300/301 receivers, and SB400/401
transmitters were indeed Heath's top of the line HF radios -- albeit
a poor ham's version of the Collins S-Line.

The VFOs were tube jobs, built by TRW. They came preassembled
and prealigned, with red "fingernail polish" sealing the screws
to deter tampering. Later Heathkits used solid state VFOs.

I built the SB401 and liked it better than my Drake T-4X. Heath
shunned TV sweep tubes and instead used 6146s in the SB line.
On a sour note, the SB401 used bizarre GE Compactron tubes, now
more difficult to find at hamfests.

I understand from talking to the Heath service folks that there is a hardware modification that can be performed on the Heath HW 24 T and HW 24 HT that will open up the receive range on UHF. Unfortunately, it also opens up the transmit range, so they will not give it to me.

Does anyone know of the mod? I would like to monitor our township repeaters and fire department. (I am an elected official of the township)

Any help will be greatly appreciated.

Thanks

In article <619@lrark.UUCP> rick@lrark.UUCP (Rick Mobley) writes:

In response to a posting from a non-ham regarding a ham neighbor
who causes TV interference (and the ham neighbor told the guy to
buy high-pass filters):

>If he is a real :-) ham, suggest he work WITH you to resolve
>the problem. If he has been licensed for a long while, there
>is a good chance he knows exactly what to do on both ends to
>reduce the interference. This is not to say that the newly
>licensed hams don't know, but most of them haven't been exposed
>to this type of problem.
>
I've only been licensed for around 2 years, and as net readers
may remember, I just encountered my first problem with causing
interference to a neighbor. Although we know generally what to
do about the problem, we've never tried to solve such a problem.
Of course we interfere with our own phones and stereos, but since
we're both hams, the other simply moves to another phone or stops
listening to the stereo if propagation is good. Can't expect the
neighbor to get off the phone every time the flux is high and
A is down, though. :-)

If this ham *is* a "real ham" and DOESN'T have actual experience
solving such a problem, he ought to find himself another real ham
who does. Hams on this net have been very kind about offering
SPECIFIC suggestions to us (specific types of filters or ferrite
beads to use, etc.). And, a couple of our more experienced ham
friends who have dealt with such issues have volunteered to help us
if our initial efforts don't work.

That's the kind of thing that really makes me love ham radio!
(People helping us out, not causing interference to the neighbors :-))

Subject: Performance of Old Gear

[deletions regarding underated components...]

It's not that the components are underated but that these are low-level
modulated radios. They are modulating a grid, base, or gate and are

only around 33% efficient. With 100 Watts DC input, they only get about 33 watts output. On the other hand, high-level modulated gear like my DX-100, where the plate is modulated are most efficient with usually somewhere near 60% or greater.

I believe this is why you can only get 25 Watts of carrier out on AM from the newer trade deficit radios. :-) and the older grid modulated rigs like my DX-60 and Knightkit T-150.

Having fun reading the discussions!! Nice to hear that some of the hams on the net are having a blast with the radios from the past. I know I do See you in the AM windows on 75m and 40m with AMERICAN MADE radios...

Subject: 40M AM window
In-Reply-To: In reply to your message of THU 07 MAY 1992 18:09:26 EDT

Hello Jim,

I'm not sure but back here in the East, many AM stations hang around the top end of the band (7290 and 7295) on 40m. I here that 7290 is pretty clear into the night. Also, have heard Texas stations and some East coast stations on or around 7160. May be that might be a better place out West. I don't care much for 20m because of the congestion and propagation.

Great on the DX-100! If you ever want to get in and make some modifications, let me know. I don't use the internal vfo and in fact have ripped it out. Gave me too many problems! My DX-100 was a total basket case with lawn clippings, pigeon doo-doo, and rust... I still have a knob on it but I believe it's one I scarfed off my DX-60.

You may be able to get 50W on voice peaks but don't hit it that hard. Causes too much distortion. You should adjust it for under 25W of carrier output, much better audio. Grid modulated radios should be adjusted for about 1/4 to 1/3 the power output of that final in plate-modulated use.

Thanks for dropping me a note Jim. Nice to hear that others out there are REAL RADIO's GLOW IN THE DARK kind of hams.

Subject: 40M AM window

Hi Russ,

Where on 40M do you find AM in the east? And at what
times?

Although I have heard and worked AM on 75, 20, and 10,
I haven't heard any 40M AM out here. I'm wondering
if it is an east coast phenomenon only.

BTW, when I do get on AM, its with the classic DX-100
like you have. (You don't have a spare VFO knob do
you? Mine is missing.)

On the DX-60 output level....are you sure about getting
only 25 watts out on AM? I would have guessed that it
was more like maybe 50 watts. As I recall, for AM you
load the final to 75W DC input and I'd expect, oh, maybe
60% efficiency.

Hi again!

Regarding the grid resistors on the 1625's: I wouldn't recommend
taking them out. I presently have 47 ohm in series with both grids
but am going to change back to 1K. You can't really overmodulate
with the 1K grid resistors, but I certainly can with 47 ohms. Don't
like it because I don't want to have to constantly watch my mod-
ulation :-)

My DX-100 had that course loading adjustment with the mica cap's
but I am generally a lazy type and when my swr is high as when I am
tuning up the antenna tuner, the mica's would pop! Replaced it with
the big variable. Don't bother to go the mica route. I don't think its
worth it.

I have only the DX-100, DX-60, Knight T-150 (2x6146s screen-modulated :)
parts from my old Collins 300G BC transmitter which is turning into my
new homebrew rig and a Drake 2B, Hammurland HQ-110 and Heathkit HR10B rx

I have modified everything except it still has the stock iron.

Any questions, just send me a note OM. I'm having fun! 73's Russ KA2KFH

Subject: 4-400 Specs Needed

Hello fellow amateurs,

I am building up a plate-modulated rf deck and wish to use a
4-400A that has been lying around since last year. I am hoping
that someone out there has the CCS recommended specs for this
tube. Am going to put about 2200 volts on the plate w/o modulation
and want to get an idea as to what kind of bias, grid excitation, and
tube impedance is required.

Also, does anyone know if I can mount an 810 in a horizontal position.
The filament appears to be supported at the bottom and top, but I would
like to make sure.

Thanks,

Russ KA2KFH

==========

Yes. BUT it can never make transform a load impedance whose value is NOT 50 Ohms (resistive) into a calue of 50 + j0 Ohms. That was true in my original posting, and it's still true today.

==========

> >If your load presents the cable with a 3:1 mismatch, then the load impedance

==========

This is incorrect reasoning. It may be 150 Ohms or it may be 16.67 Ohms, OR, it may be any number of other values which are complex. Just because the vswr is 3 is no sign that the load impedance is purely resistive.

==========

Now a quarterwave section of 50 ohm cable

Lightning rods "dissipating charge and reducing the chance of a hit" is a myth!

Lightning rods actually INCREASE the chance of a hit, but they make the hit less damaging. The following excerpt from "The Feynman Lectures on Physics" appeared on the net a while back:

A sharp lightning rod will concentrate the positive charge of the earth and bring it up closer to the source of negative charge. The lightning rods do attract lightning. A lightning strike begins with a dark leader which moves in steps towards the ground. This leaves a trail of ionized, negatively charged air which conducts well. When the leader gets close to a sharp grounded point (perhaps a hundred meters), the electric field near that point gets very large. The air ionizes there, and a trail of positive charge moves up to meet the lightning leader (well, negative charges progressively farther and farther from the lightning rod move down into the rod). When the trail coming up from the rod and the longer trail coming down from the cloud connect, the circuit is completed and the bright stroke of lightning moves up to the cloud. The current is about 10000 amps at its peak, and it carries down about 20 coulombs of negative charge.

2156. Mobile rigs in SUBARU LEGACY?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 20:56:08 UTC
From: cberthel@cc.utah.edu
Message-ID: <1992May13.145608.1@cc.utah.edu>
Source record: 289971

After all the discussions about RFI in vehicles, I did extensive research on what kind of car to buy. (I've always bought TOYOTAs but because of their policy on ham radio, I rejected TOYOTA as an option.) The SUBARU dealer called their HQ and relayed the info that use and/or installation of ham radio would not invalidate warranty and should not affect the computers in the SUBARU LEGACY. So, I bought a 1992 SUBARU LEGACY last Friday. Does anyone have a mobile rig in a LEGACY? Would you mind sharing your experience with me before I try it? Please respond to me directly.

cberthel@cc.utah.edu

Thanks.

>that shouldn't have any significant capacitance to ground, remove the
>copper on the reverse side under that pad.

I have used a similar technique described in one of the ARRL publications, (probably QRP Notebook) called "ugly construction". The ground plane is PC stock. The terminals are pieces of PC stock cut into 1/8" squares and super glued to the ground plane. Either single or double sided stock can be used.

For the ground plane, I use anything I can get my hands on, but for the terminals I only use G-10 fiberglass. (I haven't been successful in cutting cheaper boards into 1/8" squares without shattering them.)

Connections to IC's are soldered directly to the pins which have been bent out horizontally from the chip. Transistors and other components are soldered to the 1/8" square terminals or directly to the ground plane.

Good Luck, 73

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil in the directory pub/space.

> range!!

What you left out of this discussion is that you can simply put a 10 dB. attenuator in front of the receiver with the -140 dBm. noise floor and its noise floor will rise to -130 dB. along with the IM threshold rising from -40 to -30 dBm. Most receivers have selectable front end attenuation, so this is reasonable. Thus, the receivers really are equal in performance, except that the more sensitive one has the option of not using the attenuator when high sensitivity is required, such as with a loop type receiving antenna.

Another frequently overlooked point is that receiver LO phase noise is only half the problem, the other half being transmitter LO phase noise. If most of the signals on the band are coming from the popular transceivers on the market from Icom, Kenwood, etc., it is a waste of time to make your receiver LO more than around 6 dB. cleaner than the best LO's in these transceivers, because after that your selectivity will be limited by transmitter phase noise which you can do nothing about.

2164. Programming a Motorola MCX100 ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-13 23:45:00 UTC
From: vaillan@ireq.hydro.qc.ca
Message-ID: <1992May13.234500.5316@clouso.crim.ca>
Source record: 289898

Programming a Motorola MCX100 ?

I bought a commercial synthesized vhf mobile radio used in ham bands.
I would like to know how to re-program the frequencies in the N82S131 PROM.
I have a Prom burner. The radio is a 16 chanels 30 watts with a range
of 136-174 mhz.
If on the other hand you know where I could get the N82S131 prom burned
for the Motorola MCX100, please pass the info to me, I would be very
happy to send my list of freqencies and blank proms.

The crystal in this radio is a 14.4 mhz.
The divider/phase detector chip is a Motorola 6863 and it have the
Motorola number 51-83977M23 in the radio manual.
If you have any info about this chip, we may be able to figure out
how the prom is programmed!

Now if you want to guest how it is coded, here is the data stored
in the prom for the first 3 channels as an example.

```
Channel Receive Transmit PROM DATA in HEX
------- --------- ------------ ---------------------
1 147.120 147.720 BF0350FF 640260FF
2 147.270 147.870 4E0A50FF F20850FF
3 147.315 147.915 ED0A50FF 070750FF
```

NB. The data for one channel is 8 bytes long. I have shown them
in two four bytes words but the order might be the other way around
like this:

```
Channel Receive Transmit PROM DATA in HEX
------- --------- ------------ ---------------------
1 147.720 147.120 BF0350FF 640260FF
2 147.870 147.270 4E0A50FF F20850FF
3 147.915 147.315 ED0A50FF 070750FF
```

Any help or pointers will be very helfull!
Thanks for reading this message.
Clem.

2165. Re: Alinco DJ580T summary

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 00:14:21 UTC
From: dsiler@col.hp.com
Message-ID: <1992May14.001421.12082@col.hp.com>
Source record: 289884

Update: Someone asked me about the DJ580T receiving in the 800 range on 70cm
after performing the receive mod. The 580 does receive in this range,
and my primary use has been occasionally dropping in on cellular
between 880-890.

Another person has been requesting information about the 580
receiving in the 850-865 range (Police/Public Service conventional
repeater and trunked radio band.) In the Colorado Springs area I have
not had any success receiving this traffic. It was suggested that
fiddling with the the PLL adjust might help to bring the low-end down
to 850.

Are there any DJ580T owners who would care to comment on this?

2168. rapid chargers

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 03:02:00 UTC
From: msw1633@sigma.tamu.edu
Message-ID: <13MAY199222022857@sigma.tamu.edu>
Source record: 289886

Hi,
I own an Icom 02AT and have the BP8 (I dont have it in front of me right now, so I could be wrong) and another off brand battery pack, both of which may be charged with a rapid charger. My question is: can I build a rapid charger more cheaply than the Icom rapid charger? If so, how?

I really dont know that much about how batteries charge (ie. the intricacies and other considerations) and haven't followed the recent thread on charging, but will go back and read as much as I can to catch up. Is there a really good discussion of this anywhere on-line, or in a book other than the ARRL manual? I have read that and still need more info.

>By using the SO-239 connector, I can still use the '735s input attenuator and
>pre-amp (they are bypassed by the transvertor jack input).

According to the specification in the Icom Service Manual. It requires
1 volt (!) input to the transverter jack to achieve 10 db S/N. I'd say
that's too deaf to bother with. That *may* be a misprint, I haven't
tried to input a signal here. I use the separate receive input jack,
the one next to the transverter jack.

> Again, Gary, please post or email the coupling capacitor change that you
>mentioned, and please describe how it affects the transverter jack input and
>output levels (or what ever else it affects).

Rich, change C356 on the main unit board from a 470 pf to a .001 uf
capacitor. That should bring your output right up. There is one
problem though, if you don't disconnect the tranverter when you do
HF operations, your PA output may be low due to loading. So alternately,
you can move the transverter cable connection on the main board to PA1
and add another connector on the back that has the PA drive cable
attached to it. You can then install a jumper cable when you want
HF operation. The output of PA1 has an additional gain stage for
driving the PA and will drive the MMT432 without removing it's input
attenuator. This also solves any fears of having the PA come on and
fry anything and removes the requirement for feeding 8 volts to pin
6 of ACC2 when you want transverter operation. All that voltage does
is diode switch drive from the gain stage feeding PA1 to the transverter
jack. I hope that's clear.

Hello fellow Tube Lovers,

Sorry about that last posting, what a disaster!

Could someone give me the CCS specs for running this tube under plate-modulation. I just need to get an idea as to how much bias, excitation and impedance is required. Would like to place about 2200 V on the plate w/o modulation.

I am going to modulate this jug with a pair of 810's and was considering mounting the 810's in a horizontal position. Appears that the filament is supported at the top and bottom, but just want to make sure.

See you in the AM window!

>In response to a posting from a non-ham regarding a ham neighbor
>who causes TV interference (and the ham neighbor told the guy to
>buy high-pass filters):

I want to clarify one thing. A high-pass filter is the first choice to resolve interference from an HF transmitter to an -antenna connected TV or VCR-. For a CATV-connected TV or VCR, the first choice is a common-mode choke. Imagine the grief you will be in for if you tell your neighbor to buy a hi-pass filter for each of the nine TVs hooked up without the cable companies blessing and someone later has to point out that the hi-pass filters were the wrong ones! If there is a cable leak somewhere, a hi-pass filter may be necessary, but usually a common-mode choke is the right approach for CATVI. The common-mode choke may also be needed on an antenna-connected TV, sometimes in conjunction with the hi-pass.

>deletions<

>if our initial efforts don't work.

The Technical Coordinator is one good person to talk to. The TC will usually have one or more local Technical Specialists close to you who have specifically -volunteered- to help out with interference (and other technical problems). The TC may also know of the local club TVI committees and should also have valuable contacts in the local utility companies. You can find the TC in several ways:

via your Section Manger - listed, often including telephone numbers (be considerate!) on page 8 of QST.

Send email to lhurder%arrlhq.UUCP@uhasun.hartford.edu - Luck can look up your TC and send you the name and address.

> Why can't the FCC figure that out?

Back when the FCC first started letting Extras pick their own call (mid 70s)
they charged $25. There was some sort of law suit/court ruling that put a
halt to all amateur license fees. By 1976 when I got my present call there
was no fee. Maybe someone can supply more details on this.

RE: INFORMATION UPDATE: High-Altitude Balloon Flight Details

A High-Altitude Helium Balloon Flight is set for launch from the ARRL
Maine State Convention & Yarmouth Hamfest/Computer Fair on SATURDAY,
MAY 16th, at 1:00 PM, weather permitting. Onboard will be an Amateur
Radio Payload.

The exact composition of the Payload will be determined on the morning
of the launch, dependent upon prevailing winds. It's likely that at
least a beacon will be transmitting on 144.34 mHz & 28.322 mHz.

The balloon is expected to reach an altitude of over 100,000 feet
(the edge of space) before bursting and returning to earth. Amateurs
within a radius of approximately 400-miles from Portland Maine should
be able to pick up at least one of the beacon signals.

For up-to-the-minute info on the launch, tune to 7155 kHz beginning
at approximately 1200L (1600Z), and to the Falmouth 147.09 & Brunswick
```

147.135 Repeaters within Southern Maine.

Launch commander is Bill Brown WB8ELK, Managing Editor of "73 Magazine"
and well-known ATV, High-Altitude Balloon Flight, and Telemetry experi-
menter.

I have a TS-850S with its options:DSP-100, CW filters(500Hz on 455KHz, 250Hz on 8MHz) and a voice recorder unit. It does better than the rigs I used before. I used TS-520, TS-830, TS-930, TS-940 and IC-761, but TS-850 is the excellent one. I often enjoy DX contest(e.g. CQ WW or CQ WPX), and when I operate, I always use CW message function or voice message function:but operationabilty is not still good enough(e.g. before I repeat the message, I have to have turned on send switch or the message cannot be repeated). CW operation is very comfortable because I can change frequency step from 10Hz to 1 Hz that makes smooth tuning, and I can reverse demodultation of CW that makes one to choose favarate tuning. Only one trouble with this rig is the final is the same as TS-440 that wave form is not clear not like IC-781 or TS-950SDX, so my local station said the band is a little bit noisy when I transmit.
I think TS-850 is a good rig that I ever used, but still remains some problems I cannot ignore.

hope this helps some.

2181. Re: Regarding ACSSB and Spread Spectrum

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 14:36:09 UTC
From: glenne@hpnmdla.sr.hp.com
Message-ID: <14570390@hpnmdla.sr.hp.com>
Source record: 289902

In rec.radio.amateur.misc, rc@cmr.ncsl.nist.gov (Robert Carpenter) writes:

other parts of the same band. Just how far down would we expect an AMATEUR SS station to be 1 - 5 - 10 MHz away from its "carrier" frequency - given the normal imperfections in ham techniques?

Any good, quick answers? Sure, I know it depends on the characteristics of the SS signal, suggest some likely ham values, please.

Bob,
I'm sure this isn't a *good* answer, but I'll try to be quick (:>) If the tx energy is well spread (long enough PN sequence) then perhaps the question to ask is "what is the chip rate?" since that establishes the width of the resulting signal. Comparing that width to the narrowband information bandwidth (200Hz or less for EME CW and 2 KHz for SSB?) gives an idea of the suppression. Furthermore, since the narrowband/weaksignal portions of the bands are generally at the edge of our uhf and higher allocations, there is hope that there may even be additional suppression due to deliberate post-spreading filtering.

I'm playing with spreading some of my existing digital radios to combat multipath interference. I'm building up a pair of special 256 kbps ~1270 MHz radios which normally take less than 1 MHz of channel for their unspread data and I'm adding a spreading code to make that 30-40 MHz. Even without additional spreading, on random data the signal is somewhat distributed over the 1 MHz channel and a 2 KHz SSB station should only see -25 db or so signal in its passband (the noise floor would increase by this much). With the addition of 30-40 MHz spreading it ought to be down a factor of 40 MHz/2 KHz = 43 dB for a SSB bandwidth and another 10 dB or -53 dB for a weaksignal CW user. That's for a CW user who is within the SS tx frequency range but I'm deliberately positioning the radios so that they will be down much further by the edge of the band and by 1296.1 MHz. In addition, the ultimate use of these radios will be either at low to mid level sites for local user access(vertically polarized) or high level sites with directive antennas for backbones. I think the combination of spreading (whether due to the higher bw information itself or deliberate spreading) and directive antennas should be able to avoid qrm problems in the vast majority of situations. In a few rare instances it may still be possible for a weak signal user to hear the effects of a spread radio by pointing a large array using the same polarization straight at it.

I hope to have more insight into all of this pretty soon as I make some more path measurements using SS. Maybe someone else has some ideas.

2182. UPF-7 engine causing radio interference

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 15:09:03 UTC
From: Hugh_Wells.El_Segundo@xerox.COM
Message-ID: <"14-May-92..8:07:43.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 289897

I suspect that the noise you are hearing in the radio is probably caused by the generator and mechanical regulator more so than from the magnetos. You will be able to determine which, though, is causing the problem by listening very carefully to the repetition of the sounds heard. As an example, the ignition generated noise is an even rythum of plug firing dictated by engine RPM. The generator creates a brush whine which, the frequency of which, is also engine RPM dependent. However, the regulator makes a very uneven sound as the contacts vibrate.

Clues for locating and fixing the noise can be obtained from various books and pamphlets found on the shelves of ham radio electronic stores. In answer to your question, yes, capacitors and inductors will be used to reduce the noise reaching the radio. For the most part, a lot of sweat will be involved in isolating the culprit.

Having flown the UPF-7 for many hours, I'm somewhat familiar with the problems you are experiencing. I really enjoyed the aircraft and it made me a lover of round engines.

As a start, I suggest the following:

1. Obtain the book references for troubleshooting details.

2. Use a 0.1 (300V or higher) capacitor in series with a 330 ohm 1/2 watt resistor. Place the combination across the regulator's control terminal to regulator ground. Listen for a change in noise level. This combination will tend to dissipate the high pulse peaks when the regulator contacts open. You can vary the value of the two parts, but do not reduce the resistor value below about 22 ohms. This combination may be placed at both the regulator and at the generator's control terminal. One of the points will be more effective than the other.

3. Place an automobile ignition capacitor directly from the generator's output terminal to case ground.

4. Arrange the antenna coax such that it can be disconnected from the radio during flight, or fast engine run-ups to determine if the noise is entering the radio through the antenna/coax. There is a possibility of a ground loop through the coax between the point of antenna ground and the radio ground. It may be necessary to DC isolate the antenna ground from the coax

5. Place a Radio Shack generator/alternator RF filter directly at the output of the generator terminal. This will reduce brush noise.

6. Bonding the engine, regulator and aircraft frame to the firewall with heavy copper braid may help.

At the moment, this about it. Please let us know what you find for a solution.

Best regards.

> If I have a novice license that's still current, I can take the test
> for technician plus, right? That was my understanding from looking at
> the no code technician class book at Radio Shack. I would only need
> to take part 3A, I believe.

That's correct, Mike. With a current Novice license, you have credit for elements 1A (5wpm code) and 2 (Novice theory). To upgrade to Technician, you must pass element 3A (Technician theory). As soon as you pass the test and have your Certificate of Success Completion of Exam (CSCE) in hand from the VE team, you may operate as a Technician on their bands by signing "KA3NEC temporary KT" or "KA3NEC/KT". Since you have credit for element 1A, you can also operate on the Novice HF bands as a Tech Plus.

When you fill out your Form 610, one of the blocks is used to indicate if whether you want a new callsign with the license upgrade. If you want to keep your Novice call, don't mark this block. If you do want a new callsign, mark the block and you will get a Tech/General call (N3???).

Good luck!

2184. DXCC Considering Slovenia for Separate Status?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 15:37:25 UTC
From: sharon@unixland.natick.ma.us
Message-ID: <1992May14.153725.12425@unixland.natick.ma.us>
Source record: 289899

Can anyone tell me if the DXCC Committee has considered Slovenia for separate DXCC status -- or when that might happen?

Last time I asked the question, I was told that first someone must make a formal application to the DXCC. I am told by a Slovene ham that all the paperwork is in.

It continues to bother me that uninhabited rocks in the middle of the ocean somewhere are considered "countries," but a REAL country that has been internationally recognized -- with its own government, language, currency, postage stamps, Olympic teams, etc. -- still is not.

Hvala lepa (thanks in Slovene).

Craig Capell writes:
> Being new to ham radio, I'd like to get some views on the Heathkit
> monobanders(HW-22).

Wow, an oldie but a goodie. I had the 20 meter version back in the 60s. They were very nice little all-tube rigs with no real vices, but had no features at all: they would transmit and receive, but that's about it. Early versions were fixed on one sideband; upper on the 20 meter version, lower on the 40 and 80 meter versions. Later versions had switchable sidebands. I know the 20 meter version covered only a portion of the band; 14.2 - 14.35 MHz as I recall; I think the 40 and 80 meter versions also had limited coverage. I seem to recall that they were SSB rigs only, and would not do CW, although I could be wrong about that; however, mine certainly did not cover the CW portion of the band. Also, I think there was no transmitter loading control, so your antenna had to be more or less resonant. One of these rigs might make a good first rig for a new General if you can find a clean one at the right price; certainly not more than $100 with power supply, and that's if it's very clean and works perfectly; they typically go for more like $50 without the power supply. Note that the power supply provides high voltage to the rig; you can't use a 12 volt supply as you can with modern solid state rigs. You should also consider that all-band heath rigs can be had for not much more money; every hamfest I've been to in the last 5 years or so has had at least one HW-101 or SB-101 for between $150 and $200. These are much more flexible rigs, with none of the limitations of the mono-banders. Good luck...

Mike, N4PDY

2186. Examination Opportunities Scheduled 5/14/92 to 7/6/92

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 17:47:23 UTC
From: bjahnke%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <677@arrlhq.UUCP>
Source record: 289903

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information, or by mail at 225 Main St, Newington CT 06111.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team is aware that you will be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials.

AFTER THE EXAM - HOW LONG WILL IT BE BEFORE MY LICENSE ARRIVES?

If you've recently passed your initial examination for an Amateur Radio license, or if you've just upgraded, please accept our warmest congratulations! Now that you've passed the test, receiving your license in the mail is the next step.
Since the FCCs current license processing time is at about seven weeks, and since there can be additional time required within the volunteer examiner system of two weeks or so allowing your VE Team and VEC (if for Technician class or higher) time to process your application, your license might not arrive for up to eight to ten weeks.
To keep your wait for that new license or upgrade as short as possible, we are taking the following steps to give you the fastest possible service.
We have begun providing our VE Teams with express OVERNIGHT mailers for the return of applications from ARRL/VEC exam sessions to us at the VEC--and we at the VEC have begun sending our daily packages to the FCCs Licensing Facility via an express OVERNIGHT service.

We are also encouraging our VEs, and imposing
the same emphasis upon ourselves, to process examination
packages as quickly as possible to expedite your license.
Having implemented the above procedures, the ARRL/VEC
wants your wait for your new license to be as short as
possible.
If you have any other suggestions about the program, or
services we provide, please feel free to contact us.

THINGS TO BRING TO THE EXAMINATION

Be prepared to bring the following items with you to VEC
examinations: Your original current FCC-issued Amateur
Radio license (and a copy of it)--if you are licensed; Any
original Written or Code Element credit documents (CSCEs)
which are currently valid; Two forms of identification
(e.g., a photo-ID or drivers license and another item
indicating your current name and address); A calculator (if
necessary); A pen and two pencils; and, the applicable
examination test fee.

TECHNICIAN CLASS GRANDFATHER CREDIT

If you hold a Technician class license which was issued
prior to 3/21/87, you are not required to take the Element
3B (General class written) examination if you can provide a
copy of your FCC-license dated before that date. If your
licensed has since been renewed, and if you don't have a
copy of the pre-3/21/87 license, you must seek a
verification letter from the FCC. To do so, write to FCC,
1270 Fairfield Rd, Gettysburg PA 17325-7245 and request a
Form 1010-B Verification Letter verifying that you were
licensed as a Technician class prior to 3/21/87. After you
receive that form from the FCC, bring it to the test session
with you in order to claim your deserved credit.

LOST LICENSES

If you have lost your license, be aware that VECs are not
permitted to submit any upgrades to the FCC without a copy of your
current license attached to the 610 form. In order to
expedite your upgrade, you must write the FCC and request a
replacement license. Since that can take several weeks to
arrive, we recommend that you also request a Form 1010-B
verification letter from the FCC which will arrive in a
couple of weeks--and is legally binding license document.
You may use that form as a license until your Form-660
license arrives. The original and a copy of Form 1010-B
must be brought to the test session verifying that you are
currently licensed--the copy of which will be attached to
your upgrade application (in lieu of an actual Form-660
license copy). To request the Form 1010-B Verification

Letter, write to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245; indicating that you lost your license and that you are requesting that a replacement license be issued to you--also be sure to request that they send you a Form 1010-B Verification Letter verifying that you are licensed.

ACCOMMODATIONS FOR THE HANDICAPPED OR DISABLED

The FCC requires that the administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. To do so, the administering VEs may require a physician's statement indicating the nature of the disability before determining which, if any, special accommodative procedures must be used.

The VEs may accommodate handicapped/disabled examinees by administering the examination at a place convenient and comfortable for the examinee--even at bedside; for the hearing impaired the Morse code may be sent using flashing lights or a vibrating surface; for the visually impaired, VEs may read or write for the examinee; where warranted, the VEs may pause the Morse code message after each sentence/phrase, or each word, or even after each character to allow the examinee additional time to absorb and interpret what was sent--also the VEs may substitute a sending test for a receiving test where the examinee's handicap warrants.

VE Teams may need advanced notice in order to provide the necessary accommodations to examinees who require them. If you will require accommodations, please contact the VE Team in advance to advise them of your needs.

EXEMPTION OF THE 13/20 WPM MORSE CODE REQUIREMENTS

If you are a severely handicapped or disabled individual and have already passed at least a 5 WPM Morse code examination (or hold a license which meets that requirement), you may be eligible for exemption from the 13/20 WPM Morse code examination requirements. For information and applicable forms, send an SASE to the ARRL/VEC, 225 Main St, Newington CT 06111; and request our Handicapped Information Package.

EXAM LISTINGS - DEFINITION OF FIELDS

STATE
Test Date,VEC,City,,Contact Phone,Contact Person

The SECOND field in the following listing specifies the VEC which is coordinating this examination. This single-character designator denotes the VEC as defined below. An "A" (for example) indicates that this examination is coordinated by the ARRL/VEC.

For further information on any examinations listed, you may
contact the coordinating VEC.

A = ARRL/VEC, 225 Main St, Newington, CT 06111; (d) 203-666-1541
Test fee for 192 is $5.40.

X = Anchorage ARC, 2628 Turnagain Parkway, Anchorage, AK 99517;

2187. Ham Radio Classes

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 17:59:02 UTC
From: eric@abode.ttank.com
Message-ID: <1992May14.175902.3657@abode.ttank.com>
Source record: 289914

Does anyone know of any radio clubs in the San Gabriel Valley (i.e. Arcadia, Pasadena, Temple City, etc) that are going to be teaching ham radio classes in the near future?

I had to miss the last one that the Pasadena Radio Club had due to some things that came up at the last minute, but I would really like to get my ticket since I am sure talking would be a whole lot more fun than just listening like I have been.

Thanks...

Eric

2188. Re: Possible Ham Radio Interference!

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 19:38:55 UTC
From: ppddgc@uwovax.uwo.ca
Message-ID: <1992May14.153855.1337@uwovax.uwo.ca>
Source record: 289904

Some electronics manufacturers will modify recently purchased equipment
to eliminate the interference. Check with your authorized service depot.

My neighbour had a problem with interference from a source other than
my amateur equipment and Sony made a modification that solved her problem.

Don't put too much blame on the ham. Electronic gear these days can be
susceptible to various sources of rf.

Good luck!

2189. Carolina Windom/Beam Antennas - Opinions Sought

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 19:39:57 UTC
From: brucec@tekgen.bv.tek.com
Message-ID: <707@tekgen.bv.tek.com>
Source record: 289905

Radio Works from Portsmouth,VA sells these series of antennas
and I am considering getting one to put up in some tall trees.

Does anyone have an experience/comment/recommendation they
would like to share regarding:

windoms
Carolina Windoms (a tm)
Carolina Beams
Radio Works

Thanks!

Bruce Cheney NI7M

2190. Re: High Power transmitting tubes.

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 19:49:37 UTC
From: smith@oakhill.sps.mot.com
Message-ID: <1992May14.194937.3593@oakhill.sps.mot.com>

In article <15321.9205121318@mph.sm.ucl.ac.uk> davek@mph.sm.ucl.ac.UK (Dave Kirkby) writes:

>I've recently purchased a number of large valves that are made either by RCA or ITT. The RCA ones are marked:
>DOD 006

>The valves are of a coaxial construction and look designed for UHF. I have data on the RCA 7213 which is briefly:

>Does anyone know of the DOD-006 (which is marked on both the RCA and ITT tubes)?

I also have 3 of these valves (tubes) and the information was that they were from the ECM (jammer) unit on the B-52 bomber.

A G3 guy from bradford built a 2m amp with one that certainly put out a lot of oomph but when he tried to build one for 70cms it didnt work very well at all.

I investigated the problem and my sources told me that although the DOD 006 was based on the RCA 7213 it was fitted with 2 extra beam deflectors to enhance performance in the pulse mode used in the jamming unit so I guess the extra capacity does'nt help.

I'm currently building a H.F. amp with my stock of DOD 006's and naturally I've been forced to fabricate my own base/socket but it should work fine.

I have the 7213 data sheet if you need a copy.

73 Trevor AB5EU G3WQO still exiled in Texas.

2191. Yet another TVI source...

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 19:51:19 UTC
From: winter@apple.com
Message-ID: <67119@apple.Apple.COM>
Source record: 289911

Forwarded message from Rich Humphrey (N6NAE, I think):

Last night I switched on the TV to watch '60 Minutes' on channel 5, only to find the screen covered with white confetti. There were curved lines of white dots all over the picture. Channel 2 was the worst, with the video nearly breaking up, 4 and 5 were watchable, and there was nothing on the higher channels. The pattern was quite stable, never changing, so I assumed it was a PC or video game somewhere nearby with a serious RF leak.

After about an hour, the pattern changed. It was now blinking off and on, about a half-second off, with a short burst on. I thought maybe my neighbor up the road was testing again. About a mile away is an industrial park, and one of the tenants is Aydin Energy Systems, Electronic Warfare Division. They do on-the-air tests, but only rarely, and never during prime-time. Otherwise their TVI complaints would be awesome.

During the commercial break, I went in the bathroom to unplug my Norelco electric shaver. Didn't want to overcharge those nicads. It's cordless, and has a built-in rapid charger. The charger is one of those new high-power-factor corrected switchers which can be fed anything from 100 to 240 volts AC without any line voltage adjustments. There's also a green LED to indicate charging mode. It's on steady for the one hour it takes to charge, and then blinks rapidly when complete...

Well, glad to see the interference is gone.

Yes, unplugging the shaver cleared up the TVI. To verify this, I took it into the living room and plugged it in. What? No TVI. Plugging it in in the bathroom brought back the TVI. Oh well, the vagaries of household wiring. Or maybe the GFCI breaker for the bathroom outlets is causing this. Or maybe it's a radiated rather than conducted problem, since the TV antenna is close to the bathroom end of the house.

Consumer electronics scores another point!

Rich

Ok, it was the LMO I was thinking of. I knew is was something other than
a plain vanilla vfo; Madison Avenue strikes again! I was once told that
the guy who designed the SB series for Heath was the same guy who designed
the KWM-2 for Collins; hence the similarities in the designs. Anyone know
if there's any truth to that?

2193. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 20:20:56 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <1992May14.202056.10933@afit.af.mil>
Source record: 289549

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

2194. Re: Yaesu FT-990 vs. IC-765 vs. TS-850S

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-14 20:45:26 UTC
From: James_H._Lindwedel.El_Segundo@xerox.COM
Message-ID: <"14-May-92.13:43:59".*.James_H._Lindwedel.El_Segundo@Xerox.com>
Source record: 289906

Dear Jim,
As you requested, here is a shot at the comparison of Yaesu FT-990, Kenwood TS-850S, and Icom IC-765 rigs. By the way, I am pleased that I bought the FT-990 for the following reasons:
-ease of use
- analog-only meter
- wide angle viewing electrofluorescent display
- CW Spotting oscillator
- built in low acoustic noise power supply
- fast auto tuner with invocation by manual means, on band changes, and on each transmission if needed
- better SSB copy during interference, with optional 2 kHz filter rather than 1.8 kHz for TS-850S (IC-765 has 2.2 kHz standard filter)
- good noise blanker
- lower cost
- low noise fan
- SCF (switched capacitor filter) notch and bandpass filters

Note that the FT-990 hand mike response requires setting the FSP speech input bandpass to a +200 to +300 setting for best sound, according to QST note on the subject of hand mike response improvement.

Now for a few regets: The FT-990 did not have an adjustable peak SCF circuit like is in the FT-1000, which is a great help for weak CW during QSB. As well, I regretted that the rig top cover must be removed to make some inital settings. But other than that, the FT-990 seemed to offer what I wanted at a competitive price.

DISCLAIMER WARNING: The information below should be double checked before making your selection decision. Preferences on Plus, Minus, and Neutral points differ by individual application plans. Also market price varies according to purchase site and local taxes. Shop around and you may find total prices reduced by at least $100, assuming you make a cash purchase.

I have no connection with any of the rig suppliers or dealers.

Jim Lindwedel

: I will be going to the annual Air Show at Andrews AFB (Washington, DC).
: Does anyone have a list of frequencies for such a show (Andrews tower,
: ground control, Blue Angels, etc, etc)?
:
: Thanks,
: Glenn
: heinle@cmf.nrl.navy.mil

"Police Call" lists the following freqs:

Blue Angels
Air to air "Alpha" 142.000
"Bravo" 143.000
Ground Support 142.025

The tower freqs and stuff would (should...) be in my Maryland book which is at home. I will post them soon as I can. BTW, when is the show? I wanna go too!

I have a friend (KC6ORM) who has a TS 510 (predecessor to the TS 511
and 520 series...) and he can find no documentation on the thing.
Anyone out there have any manuals or sources that go back to this
stuff?

Or, if you're among those lucky(?) 35,000 or so De Anza students, bring your permit from there. It works (or so I'm told by someone who has taken classes at both places at the same time).

Of course, since I fell behind on this newsgroup, if you paid last weekend and didn't need to, tough. :)

Thanks to everyone who answered my questions! Is there a FAQ for this group?

Anyhow, I just went to the local candy store, and checked out an Alinco DJ-580T, a Kenwood TH-77A, an Alinco DJ-560T, and an Icom W2A. I've decided on the DJ-580T. It's a GREAT little radio! As soon as I get it, I'll post what I think.

Again, thanks to all!

>Can anyone tell me if the DXCC Committee has considered Slovenia for
>separate DXCC status -- or when that might happen?

Sharon--

The Pacific Division representative to the DX Advisory Committee (Jim Maxwell, W6CF) posted a note to the northern California PacketCluster a couple of weeks ago about the DXCC status of Yugoslavia. He said that the DXAC is considering the matter carefully.

When I asked whether U.S. State Department recognition would be the deciding factor, he said not necessarily--pointing out that the U.S. sometimes recognizes governments for political reasons and might change its mind abruptly. The DXAC doesn't want to rush to a decision only to have to reverse it later. So they're taking it slowly and carefully.

You might want to talk to your DXAC rep for a later update.

From: nick@sunpix.East.Sun.COM
Message-ID: <uuqksINNaj5@sixgun.East.Sun.COM>
Source record: 289913

Tube (valve) layout for the DX-100:

Looking at the rig from top with rear panel at 6:00

12:00 6AU6 on VFO sub-chassis
1:00 12BY7 9 pin
1:30 12AX7 9 pin (in the corner)
2:00/3:00 1625/1625 large 7 pin with plate caps
3:00 near the center 5763 9 pin
3:00 0A2 7 pin
3:30 5V4 octal
3:45 6AL5 7 pin
4:00/5:00 6146 with plate caps (octal)
9:00 near the center 12BY7 9 pin
9:00/9:00 5R4GY/5R4GY octals
11:00 6AQ5 7 pin

Yes these were pretty well regarded rigs in their day (mid 50's)
and many people use them for AM even today. One of the reasons
these things are so heavy is the plate modulation transformer.

Source record: 289919

>I just picked up a J-Antenna to do my 2m packet, but I don't see by
>its design how it works: it would seem the _metal_ bar across the base
>short circuits the input. Except for the short ckt, the antenna reminds
>me of a tuning fork...is this a close analogy?

The J-pole is an end-fed halfwave dipole - that's the top of the J. The
half-wave is matched by a quarter-wave transformer - that's the bottom
of the J.

A shorted quarter-wave is the same as an open circuit. Thus, you have
an open circuit looking from the half-wave toward the quarter wave
transformer - the transformer disappears. Along the transformer, you
have different impedance points - 0 ohms at the base, 50 ohms a couple
inches up, and roughly 2000 ohms at the top.

>On Mounting: Given the design of the J-Antenna and its metal base, does
>it need to be isolated from the mast (which goes deep into the ground)...
>Or can it be grounded without affecting the performance of the antenna?

The J can (and should) be electrically grounded. Because the bottom
of the J is an open circuit with respect to the matching transformer,
the dipole is RF-isolated.

Tune the J after it is grounded. There may be some effects due to
feedline shield currents. At VHF, these currents can be reduced by
coiling the feedline into three or more 2" diameter turns once it is
away from the matching transformer.

>like UHF RF and a 90 degree bend in a ground wire appears as a large
>inductance to the bolt. You want to direct the current straight down
>your tower and into the ground field.

So, what happens if you just coil up your coaxial cable before running
it into the house ? Better than nothing ? :-) :-)

You have a good point that lightning's energy spectrum at UHF is still
powerful enough to vaporize the electronics.

The commercial guys probably just drive the stakes, but I don't have my
antenna in the middle of 1200 sq ft of land. BTW, is 4" copper strap
really necessary, or would RG8/U shield be enough ?

DEFINITIONS:

Date (day only)
Possible Magnitude of Solar Flaring (LOW=C-class, MOD=M-class, HIGH=M or X)
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF SIGnal Quality (see below)
VHF Sudden Ionospheric ENHancement Probs (in %) for LOw, MIddle, HIgh Lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair, P=Poor, VP=Very Poor, EP=Extremely Poor.
VHF Sig. Quality rated as: AN=Above Normal, N=Normal, BN=Below Normal, D=Disturbed (ex. associated with polar blackouts).
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active, 5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active, 30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High, VH=Very High.

PEAK PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (15 MAY - 24 MAY)

```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

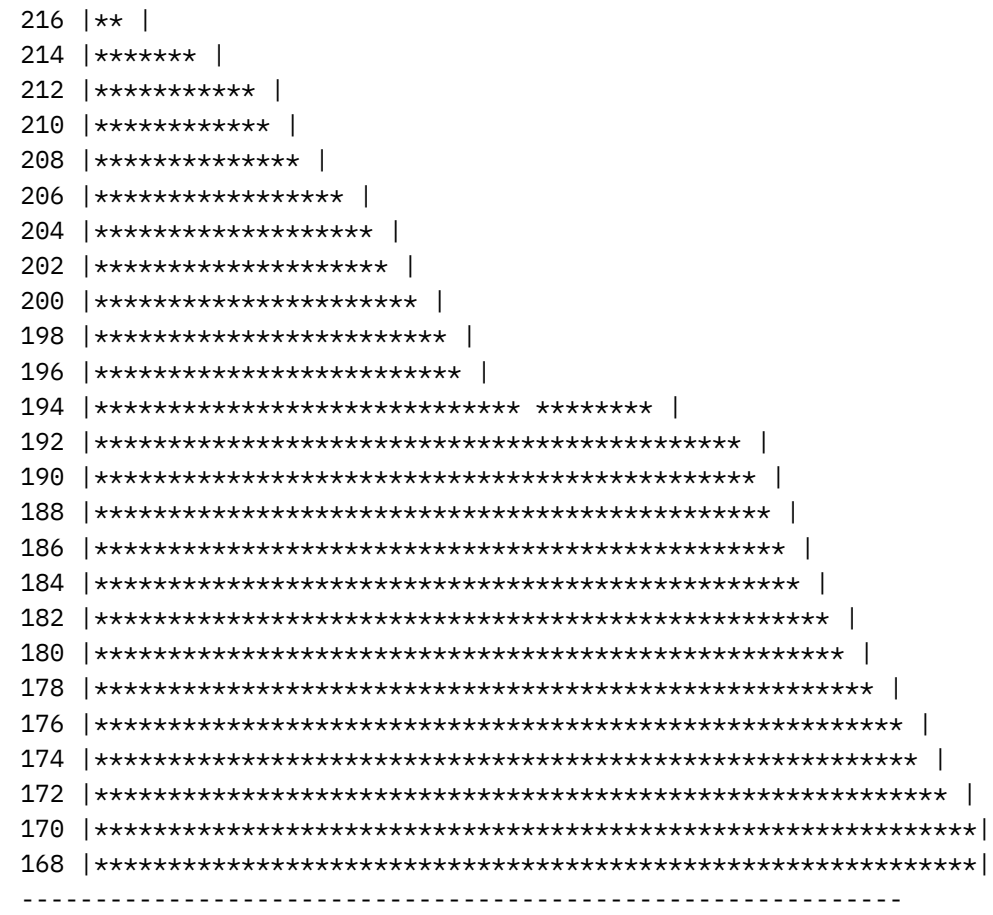
GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX

```
------------------------------------------------------------
218 | |
```



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Rho.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

2207. KV4FZ - busted!

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-15 01:36:00 UTC
From: "Jim Reisert, AD1C 14-May-1992 2138" <reisert@mast.enet.dec.com>
Message-ID: <9205150135.AA29964@enet-gw.pa.dec.com>
Source record: 289779

[relayed from Yankee Clipper Contest Club PacketCluster(tm)]

Copy of message. From: KZ1D To: N1IR Date: 14-May-1992 1828Z

According to May 15 W5YI REPORT, KV4FZ was convicted on April 24
of possessing and using up to fifteen unauthorized telephone access devices
in interstate and foreign commerce nearly five years ago. Sentencing will
occur June 26, where he is expected to get eight months in prison according
to a US Asst Attorney. An appeal is expected but since he has been suspended
from his police job without pay (as of the conviction) and his wife has lost
her job with PamAm, there is no money coming in. Strangely, he has been
named as one of eight delegates to the Republican National Convention, even
though his felony conviction was known and he had withdrawn his name from
consideration. The Virgin Islands Daily News reports he will not be
attending, since he wants to use his energies in putting his life back together.
W5YI also reports that "some ham operators now want his amateur radio license
pulled - and have made certain that the Commission is very much aware of
his conviction."

That's the gist of the W5YI report. The rest of it is a lot of detail about
the trial, the witnesses, the evidence (or lack of it, according to some).
If you want more specific info let me know and I will see if it is in the
Report. 73 Dan

To all radio amateurs

SB DX ARL ARLD025
ARLD025 DX news

Thanks to Tom, N1AJO, and the Yankee Clipper Contest Club for the following DX information.

HW CONDX? The past week has been slow at best, with next to no propagation except for on 10 meters towards Africa and 6 meter sporadic E. There was a phenomenal E skip opening which started May 12 at around 1530z, lasting until 0300z on the 13th.

There were three major openings last week. British operators from ZC4 land reported hearing the Cape Cod beacon on 50.110 MHz. Both the OX and ZD8 beacons rolled into New England with very strong signals.

MV ISLAND. The BIG operation of 4J1FS is slated to kick off on June 1. This one is to include AMTOR, RTTY, and WARC band activity.

MOZAMBIQUE. C9TDM and C9RDM try 10 meters every Saturday between 1200 and 1500z. C9RDM can sometimes be snagged on 20 meters around 0400z.

MAIL DELIVERY WOES. UA9MA has received only 40 QSL cards to date for his XV9MA operation. Please be patient.

WAIT FOR KUWAIT. The new QSL manager for 9K2GS is WB6JMS, who only has the most recent logs of 9K2GS. Older logs are to be delivered soon, so please be patient.

THE REIGN IN SPAIN. Special callsign AM0JC was heard on the air last Sunday. This is no other than Juan Carlos, EA0JC, the King of Spain.

EQUATORIAL GUINEA. 3C1EA is active again. Check between 21340 and 21350 kHz from 1500 to 1600z.

RTTY MILESTONE. JA1ACB has joined the mixed DXCC Honor Roll with every contact made by RTTY, the first amateur to do so. His most recent submission of QSLs brought him to the 315 current DXCC country level, and he has worked more since. He has been a major promoter of RTTY operation for more than 20 years, helping amateurs in many countries to operate RTTY as well as encouraging a number of DXpeditions to operate RTTY. He is an active member of the International RTTY DX Association. On the most recent, 1991, DXCC Annual Listing, his total was 315, including deletions. His closest competitors at that time were I5FLN with 311 and I8AA with 293. NNNN

Good Luck on DX de KB8NW/OBS

>While you guys are at it, could you also describe the removal of MM
>input attenuator?

After you remove the top cover of the transverter, you will see a small pot about halfway down the circuit board on the side opposite the PA housing. This is the sensitivity pot. The range of this pot is 5 to 750 mw input. There are two pins near the pot. Jumper them and the range of the pot is now from 1 to 100 mw. Adjust the pot so that with full drive the output is just below saturation. On every unit I've tested, this works out to be a 7 watt CW output. If you push the CW output past 7 watts, the SSB will start flattopping.

Gary KE4ZV

>
>Any good, quick answers? Sure, I know it depends on the characteristics of
>the SS signal, suggest some likely ham values, please.
>
>73, Bob W3OTC

As you suggested Bob, it depends on the SS technique used. For pseudo-noise spreading of a 3 kHz signal over a 3 Mhz bandwidth, the signal will be down an average of 60 db from the value of a narrow carrier. In other words, the spreading can be made relatively flat with the right pseudo-noise code. Outside the spreading bandwidth, the signal *shouldn't* exist at all, but depending on the spreading sequence, there could be spectral components out there. They can be further suppressed by a bandpass filter on the transmitter.

If the SS signal is a frequency hopper, then you only get a hit on your frequency once each sequence as the hopper hits your frequency. It's a full strength carrier present for a very short duration. Certain frequencies are easily programmed out of the hopper so that it can leave a protected area of the band where it never goes.

For the weak signal crowd, the hopper is preferred, but for the general band user, the PN system gives superior results. The band degrades slowly and gracefully as a general noise floor rise as more stations come on the band. With correlator enhancement, much like FM threshold, the average user doesn't even notice the increase in band occupancy until the usage gets very high.

Note that correlation gain works for weak signals also, so it's possible to do weak signal work *using* SS techniques. Correlation gain works much like Petit's Coherent CW in giving you an extremely narrow effective bandwidth by sampling and summing.

Steel wool yes, but you can also change your SWR by making the elements longer or shorter. The easiest way to do this is to point your antenna in the direction of the earth travel to make them longer and away from earth travel for shorter elements.

[relayed from packet]

Msg #1083 From: KZ1D Date: 15-May 0309Z Subj: The Compleat KV4FZ (1)
OK, you asked for it, and here it is! The WHOLE, unexpungatetd (sp?) article as it appeared in the May 15 W5YI Report.....

KV4FZ: GUILTY OF TELEPHONE TOLL FRAUD

St. Croix ham operator, Herbert L. "Herb" Schoenbohm, KV4FZ, has been found guilty in federal court of knowingly defrauding a Virgin Islands long-distance telephone service reseller. He was convicted April 24th of possessing and using up to fifteen unauthorized telephone access devices in interstate and foreign commerce nearly five years ago.

The stolen long distance telephone access codes belonged to the Caribbean Automated Long Lines Service, Inc. (CALLS) of St. Thomas, U.S. Virgin Islands. Schoenbohm was found to have made more than $1,000 in unauthorized telephone calls - although the prosecution said he was responsible for more (make that far more).

According to the Virgin Islands Daily News, Schoenbohm, who is also the St. Croix Police Chief of Communications, showed no emotion when he was pronounced guilty of the charges by a 12 member jury in U.S. District Court in Christiansted. The case was heard by visiting District Judge Anne Thompson.

Neither Schoenbohm or his defense attorney, Julio Brady, would comment on the verdict. The jury deliberated about seven hours. The sentencing, which has been set for June 26, 1992, will be handled by another visiting judge not familar with the case.

Schoenbohm, who is Vice Chairman of the V.I. Republican Committee, has been released pending sentencing although his bail was increased from $5,000 to $25,000. While he could receive a maximum of ten years on each count, Assistant U.S. Attorney Alphonse Andrews said Schoenbohm probably will spend no more than eight months in prison since all three counts are similar and will be merged.

Much of the evidence on the four day trial involved people who received unauthorized telephone calls from KV4FZ during a 1987 period recorded by the CALLS computer. Since the incident took place more than five years ago, many could not pinpoint the exact date of the telephone calls.

The prosecution produced 20 witnesses from various U.U locations, including agents from the Secret Service, the U.S. Marshals Service, Treasury Dept. and Federal Communications Commission. In addition ham operators testified for the prosecution.

Schoenbohm was portrayed as a criminal who had defrauded CALLS out of hundreds of thousands of dollars. Schoenbohm admitted using the service as a paying customer, said it did not work and that he terminated the service and never used it again. He feels that there was much political pressure to get him tried and convicted since he had been writing unfavorably articles about Representative DeLugo, a non-voting delegate to Congress from the Virgin Islands, including his writing of 106 bad checks during the recent rubbergate scandal.

Most, but not all the ham operators in attendance were totally opposed to KV4FZ. Bob Sherrin, W4ASX from Miami attended the trial as a defense character witness. Sherrin told us that he felt the conviction would be overturned on appeal and that Schoenbohm got a raw deal. "They actually only proved that he made $50 in unauthorized calls but the jury was made to believe it was $1,000."

Schoenbohm's attorney asked for a continuance due to newly discovered evidence but that was denied. There also is a question as to whether the jury could even understand the technology involved. "Even his own lawyer couldn't understand it, and prepared an inept case," Sherrin said. "I think he was railroaded. They were out to get him. There were a lot of [ham] net members there and they were all anti-Herb Schoenbohm. The only people that appeared normal and neutral were the FCC. The trial probably cost them a million dollars. All his enemies joined to bring home this verdict."

Schoenbohm had been suspended with pay from the police department job since being indicted by the St. Croix Grand jury. His status will be changed to suspension without pay if there is an appeal. Termination will be automatic if the conviction is upheld. Schoenbohm's wife was recently laid off from her job at Pan Am when the airline closed down. Financially, it could be very difficult for KV4FZ to organize an appeal with no money coming in.

The day after the KV4FZ conviction, Schoenbohm who is the Republican Committee vice chairman was strangely named at a territorial convention as one of eight delegates to attend the GOP national convention in Houston this August. He was nominated at the caucus even though his felony conviction was known to everyone. Schoenbohm had even withdrawn his name from consideration since he was now a convicted felon.

The Virgin Island Daily News later reported that Schoenbohm will not be attending the GOP national convention. "Schoenbohm said he came to the conclusion that my remaining energies must be spent in putting my life back together and doing what I can to restore my reputation. I also felt that any publicity in association with my selection may be used by critics against the positive efforts of the Virgin Islands delegation."

Schoenbohm has been very controversial and vocal on the ham bands. Some ham operators now want his amateur radio license pulled - and have made certain that the Commission is very much aware of his conviction.

I would like to hear more about the charges he was convicted of (the 15
unauthorized telephone access devices you spoke of) if any info is
available. This is the first I have heard of this.

Thanks!

>cheaply than the Icom rapid charger? If so, how?

Icom rapid charge packs have a thermistor embedded in the pack that senses
the sharp temperature rise of a Nicad reaching full charge and switch the
charger to trickle rate. The charger determines the initial charge rate
by switches that sense the hole pattern in the bottom of the pack.

You could duplicate the charger, but it's probably not worth the effort.

>modulation. I just need to get an idea as to how much bias, excitation
>and impedance is required. Would like to place about 2200 V on the
>plate w/o modulation.

The 4-400A wants more than 2200 V on the plate. Here's the spec from the 1963 ARRL Handbook for plate modulated AM service.

Plate voltage 4000 V
Screen voltage 300 V
Grid bias -170 V
Plate current 270 ma
Screen current 22.5 ma
Grid current 10 ma
Drive power 10 watts
Output power 720 watts
Plate load resistance 14.8k ohms

An air socket and chimney are mandatory.

>I am going to modulate this jug with a pair of 810's and was consider-
>ing mounting the 810's in a horizontal position. Appears that the
>filament is supported at the top and bottom, but just want to make
>sure.

The 810 has the following characteristics when used in a push pull class B modulator. Ratings are for a *pair*.

Plate voltage 2250 V
Grid bias -60 V
Plate current 450 ma
Grid volts 380 ppV
Drive power 13 watts
Output power 725 watts
Plate load resistance 11.6k ohms

They should be mounted upright.

I bought one of Radio Works' remote baluns. It works well. HOWEVER, after a period outside, it filled up with water. Examining it, I noticed belatedly that they didn't seal it up real well. In fact, it was VERY POORLY sealed. So when you get one of their devices in a PVC tube, apply silicon sealer liberally to all the connector and wire ports.

>fine.

Yes. One of the things that older-time Amateur Radio AMers tend
to like about AM is its ability to quiet the receiver whether or
not there's audio. Controlled-carrier modulation (sometimes
nicknamed "jumping jack" modulation according to my father,
W9BRD) works to defeat that.

I bet Gary will echo that broadcasters value AM's quieting
feature, too -- from the standpoint that listeners don't like
noisy reception. Careful AGC design would help, but c-c
modulation would sure sound noisy on most AM radios (which have
pretty fast AGC).

The BBC and other have even experimented with the inverse of the
controlled-carrier scheme discussed so far on the net: A system
that turns the carrier *up* during quieter audio passages to
increase receiver quieting when it's most needed (even more
important on shortwave [that is, skywave-propagated signals] than
on groundwave, mediumwave AM). Think one manufacturer's name for
this is *dynamic amplitude modulation*, although I may be
erroneously applying a term for something else to the system I've
described.

It's safe to say that the c-c scheme discussed here so far was
more a means of making SSB-optimized transmitters compatible with
radios that used rectification detection without beat-
frequency oscillators than a means of improving AM performance.
Heck, if you're going to go to the trouble of controlling your
carrier to keep your finals happy, why not go all the way, dump

the carrier entirely and turn one your BFO?

But I mean that rhetorically, and am neither an SSB or AM bigot.
Ham radio in the US is as much about being able to choose
technology you *want* as it is choosing technology someone
considers *best*. By not disallowing it, Part 97 allows us to use
even tangential-to-the-mainstream modulation variants like c-c AM
just because we individually think it's neat.

In rec.radio.amateur.misc, winter@apple.com (Patty Winter) writes:

Summary: Informative discussion of how an electric-shaver charger
caused TVI.

First, this might indicate a defect in the charger. Perhaps a transformer
is breaking down, and arcing. Electrical interference often gives advance
warning of a dangerous condition that must be corrected.

I agree -- I suspect differential-mode conducted interference. An AC-line
filter may help. I would try it on the charger first, but it may also
be effective on the TV. Try Radio Shack part # 15-1111. BTW - Most "surge"
filters are not electrical-noise filters.

A common-mode choke on the shaver (or TV) ac line cord may also help.

I always thought it was because controlled-carrier was a heck of a lot
cheaper than full plate modulation. Lots of rigs with *NO* SSB capability
used controlled-carrier AM. Popular low-priced rigs such as the Knight T-60
and T-150, Heath DX-60 (??), etc. were much cheaper than (and weighed 1/4
as much as) plate-modulated rigs like the DX-100 and Apache.
Later SSB rigs did sometimes use c-c as a *cheap* way to add AM capability.
The plate-modulated rigs are more highly prized today because they
sound so much better on the air.

Does this ring a bell with any other OF's ?

I would like to thank Trevor AB5EU for the info he gave me on the DOD-006. Evidently they are a special 7213 variant, which makes them unsuitable at UHF. Thanks Trevor. I tried mailing you direct, but could not sort out exactly what your e-mail address was.

Burle, who have taken over RCA, have told me the Burle 7213 is designed for grounded grid, cathode driven use. Sockets are not available.

I would be interested in any developments with your hf linear.

The 7213 does seem to be available both here in the uk and in texas, and their watts/pound (watts/dollor) ratio must be pretty good - far better than the 4CX250series tube, at least on 2m.

>right pseudo-noise code. Outside the spreading bandwidth, the signal
>*shouldn't* exist at all, but depending on the spreading sequence, there
>could be spectral components out there. They can be further suppressed
>by a bandpass filter on the transmitter.

Another factor which is often overlooked is the level of carrier
suppresion in direct sequence spread spectrum (DSSS) transmitters.
Proper carrier suppression requires careful attention to mixer choice
and mixer port termination. I have seen many DSSS with poor carrier
suppression. The carrier can be seen sometimes 10-15 dB above the
spectrum of the PN-spread energy in poorly designed transmitters.

The point is that the numbers Gary gives (e.g., -60dBc) assume a
perfect transmitter. This is just one of the many things to keep in
the back of one's mind when analyzing this problem.

Use shielded wires to the mag switch. Install coaxial caps on these wires
at the mags. Available for about $28 from aircraft dealers, maybe $5 or
less from electronics suppliers.
I assume you already have shielded mags, wires, and plugs as mentioned.

Or, get another radio. I have observed that an STS 7600 handheld aircraft
radio was unaffected by ignition noise whereas an old Narco HT800? was
wiped out in the same installation.

I'm not sure about the other three, but, as far as I know, the National Weather Service only uses three frequencies for their NOAA Weather Radio broadcasts: 162.400...162.475...and 162.550. Maybe the others will be used at some future time?

ZCZC AE87
QST de W1AW
DX Bulletin 25 ARLD025
>From ARRL Headquarters
Newington CT May 15, 1992
To all radio amateurs

SB DX ARL ARLD025
ARLD025 DX news

Thanks to Tom, N1AJO, and the Yankee Clipper Contest Club for the following DX information.

HW CONDX? The past week has been slow at best, with next to no propagation except for on 10 meters towards Africa and 6 meter sporadic E. There was a phenomenal E skip opening which started May 12 at around 1530z, lasting until 0300z on the 13th.

There were three major openings last week. British operators from ZC4 land reported hearing the Cape Cod beacon on 50.110 MHz. Both the OX and ZD8 beacons rolled into New England with very strong signals.

MV ISLAND. The BIG operation of 4J1FS is slated to kick off on June 1. This one is to include AMTOR, RTTY, and WARC band activity.

MOZAMBIQUE. C9TDM and C9RDM try 10 meters every Saturday between 1200 and 1500z. C9RDM can sometimes be snagged on 20 meters around 0400z.

MAIL DELIVERY WOES. UA9MA has received only 40 QSL cards to date for his XV9MA operation. Please be patient.

WAIT FOR KUWAIT. The new QSL manager for 9K2GS is WB6JMS, who only has the most recent logs of 9K2GS. Older logs are to be delivered soon, so please be patient.

THE REIGN IN SPAIN. Special callsign AM0JC was heard on the air last Sunday. This is no other than Juan Carlos, EA0JC, the King of Spain.

EQUATORIAL GUINEA. 3C1EA is active again. Check between 21340 and 21350 kHz from 1500 to 1600z.

RTTY MILESTONE. JA1ACB has joined the mixed DXCC Honor Roll with every contact made by RTTY, the first amateur to do so. His most recent submission of QSLs brought him to the 315 current DXCC country level, and he has worked more since. He has been a major

promoter of RTTY operation for more than 20 years, helping amateurs in many countries to operate RTTY as well as encouraging a number of DXpeditions to operate RTTY. He is an active member of the International RTTY DX Association. On the most recent, 1991, DXCC Annual Listing, his total was 315, including deletions. His closest competitors at that time were I5FLN with 311 and I8AA with 293.

QST de W1AW
Propagation Forecast Bulletin 20 ARLP020
>From Tad Cook, KT7H
Seattle, WA May 16, 1992
To all radio amateurs

SB PROP ARL ARLP020
ARLP020 Propagation de KT7H

Solar flares and profoundly disturbed radio conditions
dominated the propagation news last week, as a series of
strong flares blasted Earth with powerful interplanetary
shocks. The effect on radio conditions peaked at 1200z on
May 10 with a high Boulder K index of 8 and an A index of
99. At the same time, the solar flux on that day was the
lowest it has been in over two years, since the first
few days of May, 1990.

The solar flux is expected to increase slightly, to 160 on
May 19. Then it should drop down to a low near 120 around
the end of the month, where it could remain for a week.
There is a chance of another flare from region 7154 before
it rotates off the solar disk on May 16. Active
geomagnetic conditions could result from coronal hole
activity around May 16 and 17, but conditions are expected
to be quiet to unsettled again by May 18.

Propagation on 6 and 10 meters will be dominated
increasingly over the next couple of months by sporadic E
layer ionization, which reaches its peak late in June. E
skip distances are commonly 600 to 1200 miles, but
multiple hops can increase the range to several thousand
miles.

Beginning this week, the report in the last paragraph will
end with data for Wednesday rather than Thursday.

Sunspot numbers from May 8 through 13 were 139, 112, 81,
75, 123 and 118, with a mean of 108. 10.7 cm solar flux
for the same period was 142.6, 126.7, 124.4, 126.2, 125.1
and 125.6, with a mean of 128.4.

2233. Re: Regarding ACSSB and Spread Spectrum

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-15 17:03:54 UTC
From: glenne@hpnmdla.sr.hp.com
Message-ID: <14570391@hpnmdla.sr.hp.com>
Source record: 289811

In rec.radio.amateur.misc, gary@ke4zv.uucp (Gary Coffman) writes:

As you suggested Bob, it depends on the SS technique used. For pseudo-noise spreading of a 3 kHz signal over a 3 Mhz bandwidth, the signal will be down an average of 60 db from the value of a narrow carrier.

In this example the power will be spread 3MHz/3KHz=1000 times relative to the information bandwidth for a suppression of 30 dB not 60 dB relative to the unspread case. To be sure to "fill in" all the holes I believe a sequence length of at least 2^10=1024 would be required. This could be a 10 bit shift register. Last I knew, amateurs are only allowed 7, 13 and 19 bit spreading codes so the 13 bit code would have to be used to ensure this. Otherwise it might be possible for an unmodulated carrier,say, in the original information to exceed the -30 dB number.

In other words, the spreading can be made relatively flat with the right pseudo-noise code. Outside the spreading bandwidth, the signal *shouldn't* exist at all, but depending on the spreading sequence, there could be spectral components out there. They can be further suppressed by a bandpass filter on the transmitter.

This is not generally true. Without post-filtering the envelope of the common BPSK direct sequence spreader is a sin(x^2)/x distribution and continues indefinitely. By filtering to the first minimum, which I believe is commonly done, the signal may be later reconstructed without unmanagable distortion.
The particular spreading sequence hasn't any effect on this overall envelope shape. The position of the first minimum is set by the chip rate.

2235. Guide to the Personal Radio Newsgroups

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-15 17:35:00 UTC
From: pschleck@odin.unomaha.edu
Message-ID: <personal-radio-intro-1-705950953@unomaha.edu>
Source record: 289802
Cross-posted to: rec.radio.amateur.misc,news.answers

Posted-By: auto-faq script
Archive-name: personal-radio-intro

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, and rec.radio.swap newsgroups. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 February 1992.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began to dominate other topics in the group and on the list. This resulted in the logical solution: a group was created to hold the packet discussion, and another corresponding mailing list was created as well: net.ham-radio.packet and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great Renaming essentially unchanged, moving from net.ham-radio[.packet] to rec.ham-radio[.packet]. Readership and volume grew with the rest of the network.

The INFO-HAMS mailing list was originally run from a US Army computer at White Sands Missile Range, SIMTEL20. There were few problems with this arrangement, but one was that the system was not supposed to be used for commercial purposes. Since one of hams' favorite pastimes is swapping gear, it was natural for hams to post messages about equipment for sale to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use restriction, and after some argument, a group was created specifically for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups,

and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the structure we now use.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.packet is for discussions related to (surprise!) packet radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgable folks in radio digital communications can be found here, and anything in the general area is welcome.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups are the place for public discussions.

The reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. The neverending no-code debate goes here, as does the New Jersey scanner law, the legality of ordering a pizza on the autopatch, what a bunch of rotten no-goodniks the local frequency coordinating body is, and so on.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest

to both hams and CBers - and very few topics are.

The rec.radio.amateur.misc, .packet, and .policy groups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for details. You can also post to rec.radio.swap by sending email to rec-radio-swap@ucbvax.berkeley.edu; if you do it this way, be sure to include an address for responses by electronic mail, as the gateway does not automatically do so.

A Note on Crossposting
======================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

>I am thinking of buying a Kenwood TS-830S (used of course) as my first
>radio. Could anyone tell me what is the current price (roughly) for this
>radio?

A pretty good radio, overall. I own and operate a Kenwood TS-530S which
is a scaled down version of the 830. I find that the prices of the 830
runs between (roughly) $550 and $650. The accessories are extra, and
the VFO 230 (digital) is hard to find and expensive. The standard external
VFO (240) is around and reasonable.

A LOT of hams used the 830 (and still do). There are articles on them
and a lot of experience with them out there. It is a safe bet. I
recommend it highly if you can pick one up for a decent price that is
in good shape.

2241. Inter-repeater Interference

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-15 19:18:15 UTC
From: lapin@casbah.acns.nwu.edu
Message-ID: <1992May15.191815.8899@news.acns.nwu.edu>
Source record: 289806

The club that I belong to currently is having a problem with interference with a repeater on an adjacent channel on 2 meters. I am soliciting experience and suggestions on this type of problem.

The assigned output frequency of our 2 meter repeater (147.345 MHz) is 15 kHz below that of another repeater located about 25 miles away and we transmit through a 100 watt amplifier. We have received complaints from members of the other repeater association who live near our repeater site that their repeater is interfered with when we are transmitting. In an attempt to be good neighbors, we have decreased ourmodulation index to just over 50% in order to stop this interference.

Now we have a dilemma. Our repeater is very quiet and requires that audio levels on our receivers be turned way up just to hear what is said. Our signal is much weaker than it should be and our coverage is not what it once was. Then there's always that FCC regulation that stations should modulate 100%.

Since repeaters are commonly spaced 15 kHz apart in the US, this problem must come up rather often. If you have had a similar situation, please reply via the net or email, particularly if you found a better solution than undermodulating.

Source record: 289807

I added a Landwehr 2 meter preamp to my OSCAR setup last winter. Now that the lightning season has arrived, I am wondering how it will hold up?

Is it wise to place a gas discharge arrestor between it and the antenna or are the relays able to pass voltage spikes to an arrestor placed at the entrance to the shack?

If I disconnect my antenna when not in use (until I get a good arrestor), should
I also short the coax going to the antenna/preamp to protect the preamp?

Bob also mentioned he ran 180 watts with rf sense switching. I thought they were
rated closer to 150 watts. Just how high can you go?

Any comments from others on how to set up OSCAR systems with the Landwehr preamp?

Does anyone else out there have a J-Beam for the 70cm uplink? I have just one that is Horizontal polarized. Has anyone phased two together to get circular polarization?

From: ron@pilot.njin.net
Message-ID: <May.15.15.41.13.1992.1986@pilot.njin.net>
Source record: 289808

- What is DTMF encode/decode?

DTMF = Dual Tone Multifrequcy, generic name for TouchTone which is the sound a push-button phone makes when you push the buttons. TouchTone used to be a trademark until it got lost in the divestiture shuffle. DTMF encode is just putting touch tone buttons on your radio. Most ham VHF-FM gear has them now for invoking control functions (and even telephone features) on repeaters.

Decode detects DTMF tones. Obviously the repeater needs to do this. Some radios also use this for control or squelch functions.

- What is DTMF Paging?

Causes "beeper" like functions when a certain DTMF tone sequence is received.

- What is CTCSS encode/decode?

CTCSS, also called sub-audible tone or by various radio manufacturers trade marks for it (PL, ClearCom). A low level fixed low frequency tone is continuously transmitted (encode). Decode detects the presence of this tone. This is usually used to mute (squelch) the receiver to either keep unwanted signals out or to allow for selective calling.

- What is DTMF (or DSQ) Squelch?

DTMF squelch mutes the receiver until a certain DTMF tone pattern is recieved. DSQ does the same thing only it listens for digitally encoded tones. The advantange of DSQ is that you can encode things like call signs in it. The disadvantage is that the encoder is some custom thing rather than piggybakcing on the DTMF encoding that most rigs already h ave.

>by switches that sense the hole pattern in the bottom of the pack.

>You could duplicate the charger, but it's probably not worth the effort.

Actually the pack contains a common thermostat that opens the charging
circuit when the batteries start to warm at the end of the charge cycle.
In the BP-8 pack I just opened to verify, the thermostat is set to
45 deg C and is made by PEPI, a common brand. These little thermostats
are common on the surplus market and can be added to a battery lacking
it if access can be gained to the individual cells.

The fast charger sold by Mr NiCad is nothing more than an unregulated
DC power supply with a normally open relay in the path connected to
use the second NO contact as a latching contact. The battery is
inserted in the charger and a pushbutton on the front is pushed to
start the charging. When the thermostat opens the charging path, the
relay drops out and charging voltage is removed from the battery.

This is not the optimum way to charge these batteries but it is the
Icom way and is trivially easy to duplicate. After a fire
destroyed my Mr Nicad charger I built another one from Radio Shack parts.
The battery holder is fabricated from soldered together double sided
PCB and bolted to the top of a project cabinet. Battery contacts are short
pieces of ball point pen spring soldered to isolated pads of copper on the
bottom of the battery holder. Stuff to buy from RS:

12 volt, 2 amp transformer
Bridge rectifier.
DPDT 12 volt coil relay
Cabinet
NO pushbutton
suitable dropping resistor if needed.
optionally an LED for charge indication.

If you use only a half-wave bridge and set the average charge current
to the recommended quick charge value, you will have approximated
a pulse charger. This is essentially the circuit used in my very
expensive laptop quick charger.

2246. 2 element beam using Hamsticks for 18 Mhz

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-15 20:06:31 UTC
From: nk30@cbnewsm.cb.att.com
Message-ID: <1992May15.200631.27264@cbnewsm.cb.att.com>
Source record: 289810

Does anyone have experience with making a 2 element beam from
hamsticks. I was thinking that something like this would work for 18 Mhz.
The antenna's bandwidth should cover the whole band. What would the feedpoint
impedance be since the the whips are inductively loaded?

Thanks in advance. NK3O Jeff

Source record: 289826
Cross-posted to: rec.radio.swap,rec.radio.amateur.misc

I'd like to see about renting an antenna of 20 or more dB gain, suitable for use at 456 MHz, to use in a remote broadcast from San Francisco later in the year. We need to work Black Mountain from the St. Francis's roof with 15 watts, delivering a broadcast-quality (solid 10 to 15 KHz audio) signal.

A reasonable rent and even damage deposit would be acceptable. Thanks.

[All you lawyer wanna-bes who love to flame before asking, look in Part 74.]

> the RF section.

I was around the Denver NWS when they launched one last year. It seemed to drift some and be fairly wideband - around 403.16MHz. I got to see one a farmer captured and it had LORAN on it. Appeared to be a 100KHz RF front-end (not very exciting) which then modulated the main carrier. It would seem fairly easy to extract this from one of the wider IF stages in a receiver and feed into a standard LORAN box to get coordinates. The reason I mention this is the ham balloon folks might make use of it - especially when considerable equipment expense is involved. A "real-time" computer map would be cool too of course. I think one could perhaps route the 100KHz LORAN signal through the typical balloon video transmitter.

I don't know if Denver NWS uses radiosondes any more - they may use one of the fancy radar toys instead.

2254. Hammarlund SP-600

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-15 23:31:50 UTC
From: sieh@ie.engr.wisc.edu
Message-ID: <1992May15.183150.5058@doug.cae.wisc.edu>
Source record: 289818

Some questions on Hammarlund SP-600 shortwave receiver:

Selectivity Knob-----There are six different BWs, 3-8-13 Khz are
grouped into "Non-Xtal", .2-.5-1.3Khz are grouped into "Xtal".
Are crystal filters included in every SP-600? If they are optional,
where are they installed, or which part of the radio shall I exam to
see if they are installed?

Audio Output----There are three different audio outlets, one for
the headphone at front, the other two PHONO and AUDIO OUTPUT are
located on the rear. What's the difference between them?
What's the use for the terminals labeled JUMPER on the AUDIO OUTPUT
block?

Gerneral Comments on this radio are also welcome.

I would also like to get hold of a copy of the manual for this radio.

Thanks in advance.

I think the normal solution is not to assign adjacent split frequencies
to repeaters only 25 miles apart. There probably is no really
"good" solution.

From your posting, it sounds like you have reduced your deviation from
the normal 5 kHz to 2.5 kHz. One partial solution would be to tune
your repeater's transmit carrier 1 kHz or so below the nominal channel
frequency. Then you could increase your deviation to 3.5 kHz with
no more interference to the other machine, while keeping the entire
signal within the passband of your users' radios.

Before anyone gets too excited, remember that that narrow effective
bandwidth is the same as the narrow bandwidth system would have had.
You really don't come out ahead of a narrow band system.

I would like to learn more about spreading techniqes to help
with frequency synchronization problems on very weak signals or
using microwave frequencies where getting down to the nearest
tens of hertz may be difficult.

2259. Handheld for someone on a budget

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-16 01:16:42 UTC
From: mrosen@isis.cs.du.edu
Message-ID: <1992May16.011642.27202@mnemosyne.cs.du.edu>
Source record: 289821

I've had some good responses with some suggestions for handhelds; thanks for all your input. I think I may be going over my head looking for a dual band radio, possibly. I'm hoping to save up money to spend about $200-300 on a radio. Do any good dual band transceiver/scanners fall within this range? If not, how about single band on either 2m or 70cm probably? Something with DTMF encoding and the ability to recharge batteries would be preferred.

Thanks,
Mike

ps. What are the good magazines that mail-order dealers advertise in?

It rings a bell with me... I remember saving up my pennies for the NEWLY INTRODUCED T-150... the only voice rig I could possibly afford. Most of the people I talked to on it didn't like it - I got lots of complaints about the audio quality. So many, in fact, that I eventually used a 75 watt audio PA amp that I had and an old TV power transformer, and made it into a straight AM rig - sounded much better. It generated more heat too, which was a Good Thing, since the shack was in a basement.

2261. Spread Spectrum and Narrow-band Users

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-16 02:15:29 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9205160215.AA16322@cmr.ncsl.nist.gov>
Source record: 289823

Thanks are due Glen N6GN and Gary KE4ZV for reponding to my leading question about signal levels "way away" from spread spectrum (SS) transmissions. I say "leading question" because I wanted to point out that the "60 dB down" numbers can still be pretty large sigs compared with the 200-250 dB path loss that the desired weak DX signal may have seen. I have no doubt that Glenn and Gary are good-neighbor hams, but worry about SS in the hands of Joe-Clod Ham.

See, we can all find something to fear about more-advanced technology.

And, yes, I know that SS works with weak sigs, but just wanted and evaluation of the effects on current-style operation.

73, Bob W3OTC

==========

For more information about the call sign assignment in the Amateur Radio Service, see Section 97.17 (f) of the FCC Rules, or write to the FCC, Consumer Assistance Branch, Gettysburg, PA 17325-7245.

This list is updated monthly by
Mark WB1E @ K1RQG.ME.USA.NA
WB1E @ K1RQG.04416

NOTES:

* This call (Group A for Amer. Samoa) was printed this month as AH8A by the FCC...I think a misprint as it has been AH8D for several months.

District 5 Group C calls are depleted and have moved into the Group D series, as districts 4 and 6 have done. So again, if you're a novice in the 4, 5 or 6 districts and upgrade to Tech or General, don't put in for a new call or you will get another 2 x 3 call!

District 1 Group D calls are about to change to KB prefix.

73 till next month...

2263. packet intro info

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-16 02:59:07 UTC
From: VIDGAMES@biotechnet.COM
Message-ID: <920515225837.20e06d72@biotechnet.com>
Source record: 289824

I'm looking at getting into packet, but I'd like to keep my investment low.
Can anyone recommend a decent but inexpensive TNC and refer me to--or
better, send me a BINHEX of--some Mac packet software? I don't have FTP
access, so I can't d'l software directly. Also, how hard would it be to take
that TNC and put it on a Radio Shack Model 100 for portable packeting?
Finally, can anyone point me in the right direction to hooking up an
FT-411 HT to that TNC?
Thanks in advance for your help...

I just bought the DJ-580T. It's the best! In addition to 2M and 440MHz, it has
recieve of aircraft, business, some public-service, and cellular.

It would probably cost the federal government more than $25 to collect the
$25, the way they operate. I don't see what the big deal is, I mean we're
not talking about sophisticated software here. I could write a tracking
system for callsigns in less than a day that would allow them to easily
reissue callsigns. Type in the requested callsign, either its used already
or not, if not issue it. Would add maybe 30 seconds to their processing time.

Unfortunately there is another repeater in the area 15 Khz below, but
somewhat farther away. What Greg didn't mention is the repeater at 147.36
is a closed DX repeater. The users are of the type that listen
breathlessly for any traffic on their channel. The crosstalk they
occasionally hear is understandably obnoxious to them. If this were a more
conventional machine, I think the interference would be better tolerated.

It should be pointed out that our repeater output was checked and spurious
emissions were below that required by Part 97.307.

I am one of the members of the club who has complained about the low
deviation. I find it extremely hard to carry on a conversation while
mobile. The lower volume of our machine compared to correctly adjusted
ones turns my HT into a BOOM box with regularity while in scanning mode.

The repeater has been run in this mode for several years. Any changes on
our part at this point will more than likely result in charges that our
repeater output is putting out excessive spurious signals. Even in
the current configuration, when one of our members with slightly more
generous audio transmits there have been complaints. Strangely, those
complaining blame the the individual members equipment rather than the
repeater. Dealing intelligently with those experiencing the crosstalk is
as much of a problem as anything else. Personally, I would suggest a good
frequency check of the recievers involved, a high gain directional antenna and
if necessary an up to date reciever. I don't speak for the club on any
of these matters however.

My Icom IC-M2 (marine hand-held) manual lists the following weather channels:
WX1 162.550
WX2 162.400
WX3 162.475
WX4 161.650 (marine channel 21B - used by Canadian Coast Guard for b'casts.)

I also have an Icom IC-M55 which allows you to select weather channels 1 - 10, but only the 4 listed above are active, I believe (the manual is on my boat).

2268. Re: rapid chargers

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-16 05:20:16 UTC
From: brian@ucsd.edu
Message-ID: <v262gINNfbh@network.ucsd.edu>
Source record: 289829

In the Panasonic battery engineering manual there's some VERY good information on rapid charging batteries. One of the techniques I liked most was to watch the voltage of the NiCad as you shove current into it; it turns out that just before you reach full charge, the terminal voltage stops increasing and instead DECREASES slightly. By watching for that change in the derivative, apparently you can switch from rapid to trickle (maintenance) charge quite accurately.

Commercial walkie batteries (e.g., Motorola) have a fuse, a thermal sensor (thermistor), and a charge rate resistor in them to communicate some of the battery's vital stats to the charger. Even so, in normal service, it's unusual to get more than a couple of years of service from a battery used with a rapid charger. Price you pay for convenience, I guess.

>anode- or collector-modulate. You can get higher efficiency (70%) this way;
>also, the power in the sidebands is supplied from the modulator, rather
>than by varying the efficiency of the PA itself.

Class AB1 "valve" amplifiers routinely make 65% efficiency. The ones in our broadcast TV transmitter do. Now solid state amps are generally somewhat less efficient, but don't have a heater or large cooling blower to reduce the amp's overall efficiency. At amateur power levels, there's little difference between 65% and 70% efficiency. Big class B plate modulators eat a lot of power too, and rarely see better than 50%-60% efficiency. For *output* power in plate modulated AM, you have to sum the modulator in with the PA, and factor *it's* efficiency into transmitter efficiency as well. In modern solid state amps the difference in efficiency between class AB1 and class C is so small that the amps normally are operated in linear fashion even when in FM service.

>I always used to design on the basis of CCS ratings rather than ICAS, but
>that was because i used to be into RTTY and SSTV which are not exactly
>transmitter-friendly.

Well of course here is where the real difference lies. SSB has a peak to average ratio of 4:1 to 8:1. That means the steady CW rating of the amp can be much smaller than the peak rating while being electrically and thermally adequate for the intended service. Add to that a transmit/receive ratio of 1:1 or less, and you have 100 watt radios that can only sustain

25 or less watts of continous carrier. This isn't a deficit for the intended service. Instead it allows less massive and less expensive radio designs to be used with great success.

>>inductance to the bolt. You want to direct the current straight down
>>your tower and into the ground field.
>
>So, what happens if you just coil up your coaxial cable before running
>it into the house ? Better than nothing ? :-) :-)

Coiling the cable can indeed be a good idea *if* you have a good gas
discharge arrestor *before* the coil. The inductance charge time will
allow the gas discharge device to fire fully before any dangerous
voltages reach your equipment. If the gas discharge tube is *after*
the coil, the coil makes things worse since the risetime of the lightning
pulse has been lowered and lengthened. This will slow the firing of the
gas tube and reduce it's effectiveness. A lot of energy can be stored
in that coil, you must provide some mechanism to dispose of it that
doesn't include a path through your radios.

>The commercial guys probably just drive the stakes, but I don't have my
>antenna in the middle of 1200 sq ft of land. BTW, is 4" copper strap
>really necessary, or would RG8/U shield be enough ?

1200 square feet is just a square 34.6 feet on a side. The guy points
for a 70 foot tower should be at least 41 feet from the base. So, if
you have enough room for a tower, you have enough room for a ground
field. The 5" strap is very much superior to cable. Skin effect is
very pronounced with lightning. So while heavy copper wire may be
able to carry the current, it will present a relatively high impedance
to the lightning pulse. That's not what you want in a ground connection.
Coax braid has more skin than solid wire, but the way it's twisted it
also has more inductance per strand. Flat sheet is preferred.

]
]Is that "reciprocal"???

Remainder of spelling flame deleted.

I spent 3 months in Paris last year. I got a reciprocal license by
using forms provided by ARRL. I used it on two meters to talk to my
daughter (who also had a recip license). I found the French hams on
2 meters to be unfriendly - I don't speak French, and they informed
me that they don't like to talk English on the radio. Everyone else
in France (other than the taxi drivers) was very friendly, but most
(not all) hams were not.

2273. Re: Anyone tried Alinco 560T or 580T?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-16 16:19:28 UTC
From: dxandy@cs.widener.edu
Message-ID: <v3cmgINN5vc@ashley.cs.widener.edu>
Source record: 289837

I just got a 580 too and I am very impressed with it. I have used
the airband and cellular telephone rx with no problems. It has all
the features of other much more expensive radios. The only grouse I
have is with the antenna, as with all rubber duckie antennas they are
as about effective as a damp noodle. I made a makeshift half-wave
dipole and the reception improved about 1000% (the difference between
not hearing the wx radio and getting it full scale). I was also able
to bring up the local repeaters on lo-power where before I needed full
power.

The radio is very solidly constructed too. Considering it costs
about the same as most single band HT's, it has to be the best buy on
the market at the moment.

Err... if we spread a 3 KHz signal over 3 MHz, we get a 30 db reduction.
We will get an infinite reduction over an unmodulated carrier (if we
are looking at spectral density, which is the only thing that makes
sense here).

This is the reason that Texas went to 20 kHz channel spacing a few years ago. Once upon a time, we were using inverted 15 kHz channels, which worked well. Our studies showed that upright 15 kHz channels (which the VRAC, in its finite wisdom, would have forced upon us) were simply not acceptable for much less than full co-channel separation. 20 kHz channels, on the other hand, can be placed next to each other with no problems.

About all I can suggest is that you ask your local coordinating body for a different pair, as there's not much technically that you or your group can do to reduce the interference and still maintain reasonable levels of transmit audio.

RACESBUL.222 DATE: May 18, 1992
CATEGORY: MGT
SUBJECT: So you want to equip an EOC?

If you are starting from scratch in utilizing communications
volunteers in an EOC or office, funds can be hard to come by.
In such cases, the funds may have to come in segments, rather
than all at once. Many EOC Amateur Radio communications have
begun with the installation of only antennas and coaxial
fittings. This simple, but critical step, allows the Amateurs
to bring in their own radios and computers and setting up for any
emergency or exercise. Time consuming, but it is a way many
agencies have begun. It does have its drawbacks in late arrivals
and no shows. The next step should then be implemented --
installing the necessary agency owned equipment permanently.
Then the operators need only to report for duty. The equipment
is already there and ready to operate.
Scheduling of operators and assignments is a task for the
Radio Officer to delegate to the operations assistant, although
in a small organization the Radio Officer may have to do this
activity. The Radio Officer need only bring in the people with
operational skills, not be an operator. In fact, the indication
of a good manager is the ability to stand back and manage and
assist without getting bogged down in doing other people's work.
Properly staffed and trained, volunteers should be able to
function with or without their leader. This requires depth in
personnel and skills, of course. The capable leader (i.e., Radio
Officer) does not try to do everything. Instead he or she brings
out the unique talent in others and fits them into those places
where their services are useful to the agency and meaningful to
the volunteers themselves. It's a win-win situation all the way
around.

2277. Yet another out-of-date question in the exams

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-17 00:44:31 UTC
From: ardai@teda.Teradyne.COM
Message-ID: <43668@teda.Teradyne.COM>
Source record: 289842

I just picked up some exam study guides, and have found a question for the advanced test that has been rendered out of date by technology:

4AF-4.5 What colors are available in LEDs?
A. Yellow, blue, red and green
B. Red, violet, yellow and peach
C. Violet, blue, orange and red
D. Red, green, orange and yellow

The official answer is 'D', however 'A' is also correct.

>
>Gary KE4ZV

Why does the carrier have to be phase coherent in order to
recover speech ?. You are a little cagey when you say speech
waveforms (for which this is true). For many many years we all talked over
FDM-SSB telco carrier systems with random phase intercept points (and
even multiple hertz frequency offsets!!) and never noticed the difference.

The human ear is not significantly sensitive to relative phase
of frequency components in speech or even music - otherwise SSB and
much audio signal processing wouldn't work.

The only situation in which the relative delay of the pilot carrier
and the information would make any difference is if the signal (or the
receiver LO's) were very unstable and the signal at the demodulator was
moving around very fast. This is unlikely under under normal scenerios
with xtal references for sythesizers and normal vehicle accelerations.

Notes of interest:

Bangladesh (S2). With great surprise S2/HA5BUS showed up on RTTY doing a marvelous job on the air. The operator Imi (HA5HO) is transmitting from Dhaka and states they will be active till April 21 or 22nd. We all hope the DXAC Desk will accept this operation as done earlier for EP/HA5BUS . QSL goes to GLOBEX Foundation, Box 49, 1131 Budapest, Hungary. Their next stop will be Malaysia.

N5PSI, Mike, informs us that he became the QSL manager for 5N3ZIP. Prior to this, the Nigeria station didn't have a QSL route or QSL's. Mike will attempt to get past logs for contacts prior to April 92'. N5PSI is good in 91' and 92 callbooks. Pse QSL direct only.

ST. Kitts (V44). A Japanese group plans to be active from this Island from April 29th til May 3rd on CW, SSB and RTTY.

>From Friday April 24th Syd, (VK2SG) will take back the notes. Many people, TG9VT among others, will be in Dayton and for that he cannot distribute as normal the notes. So those interested must pick it up themselves from TG9VT APlink. VK2SG will see that it is in TG9VT box. Be welcome and the next week everything be normalized.

Thank you all for the help during Syd's absence and let me end by wishing the readers, Happy Easter.

I hadn't heard of the BBC scheme, but I have heard of dynamic amplitude modulation. That's a method where the carrier is turned up on modulation *peaks* to allow more than normal 100% modulation in the positive direction. Negative modulation swings can't exceed 100% because that represents carrier cutoff and just generates splatter. The FCC will allow up to 110% of licensed power for brief periods. Some broadcast manufacturers take advantage of this by enhancing positive peak modulation.

This is different from controlled carrier modulation because the carrier enhancement occurs at an audio half cycle rate rather than at a syllabic rate. You can see it on a spectrum analyser, but not on your S meter. Subjectively it sounds a lot "punchier" than normal modulation. Naturally it adds distortion, but rock stations often consider it "good" distortion.

>
>Does this ring a bell with any other OF's ?

If I remember correctly, I think you're confusing *screen grid* modulation with controlled carrier modulation. Controlled carrier modulated transmitters can still be plate modulated, though they weren't usually done that way. Usually they used an SSB linear amplifier after the low level modulated stage.

Screen grid modulation works by reducing the *gain* of the class C RF stage at an audio rate. This results in AM, but usually not a full 100% modulation, and certainly not the 150% power boost on peaks given by plate modulation. Instead, class C output is reduced from maximum when no modulation is present, allowed to reach maximum on positive peaks, and allowed to reach minimum on negative peaks. To avoid severe disruption of the stage's operating point, modulation depth was usually restricted to the 70% to 80% range.

I *know* the Viking Challenger worked this way and I *think* so did the DX-60 and Knight transmitters. You *could* add an external plate modulator to any of them if you wanted to.

2288. Cell Phone Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-17 14:16:36 UTC
From: bartb@hpfcmgw.FC.HP.COM
Message-ID: <19530043@hpfcmgw.FC.HP.COM>
Source record: 289862

In shopping around for a cellular phone, transportable type, I've found the sales and tech folks at stores providing me with some interesting information about the antennas. Transportable cell phones have about 3 watts of output power to their antenna. I've asked what type of antenna the transportable's have; the common answer is a 3/8ths wave. That's a different type than I'm used to hearing about, so I asked the store folks what a 3/8ths wave gain is compared to a standard 1/4th wave. Their answer at three different stores from the technician in the back that fixes them has been -6db.

My response to that was kind of `wow, why is the output one fourth as much as a standard 1/4th wave antenna' or words to that effect. I'm no expert on RF transmission lines and antennas, but something is missing in my dialogue with folks about this. So, if any hams might please explain to, or help me understand what's happening, I'll appreciate it.

No doubt, a 3/8ths wave antenna needs some loading to make it work.

I think a 1/4th wave antenna for 836 MHz (center of cell phone xmit band) is about 3.4-in. long; a half-wave dipole would be about 7.8-in. long. The cell phone (transportable type, not hand held) antenna's are about 10 or so inches long; about right for a dipole with 3/8ths wavelength on each side. My comments to store folks has been that I would like to use the full power out of the unit; perhaps add an aftermarket antenna like those that are about 13-in. long with about 3 to 4 db gain. Their responses center around talk that suggests another antenna won't help that much. My own math tells me that replacing a -6db antenna with a +3db antenna will increase radiated RF by about 9db. Am I mistaken in my theories? I'd sure like to know; that's why I'm posting this note amongst a world of experts.

Your responses will be appreciated; email or direct.

> ==========

Well yeah, that's a true statement. I was trying to keep this simplified
to make explaining how a 50 ohm cable can be an impedance transformer
simpler. Reactive effects, if present, and they often are, will complicate

things in the real world. Then you've got to get out the Smith Chart.

>Now a quarterwave section of 50 ohm cable

>> Zack KH6CP/1

No, I haven't transposed the numbers. I'm not shooting for a perfect
match to 50 ohms. That's impossible with 50 ohm cable. I'm showing
that you can use 50 ohm cable to get *closer* to 50 ohms by taking
advantage of transmission line transformer action. It doesn't sound
reasonable at first, but that 3:1 SWR makes it possible.

>> >to 50 ohms than 150 ohms. Sure the *cable* may have an SWR of 3:1,

There's certainly one in mine. It's in that PVC section that connects
the ribbon line to the coax. Now G5RV may not have used one in his
original design, but it's in those being sold commercially under his
call.

Art, I ran this through my extractor (nasa translator) and came up with
the following:

Satellite: Mir
Catalog number: 16609
Epoch time: 92121.790142
Element set: 256
Inclination: 51.599600 deg
RA of node: 124.959600 deg
Eccentricity: 0.001553
Arg of perigee: 12.207800 deg
Mean anomaly: 347.904900 deg
Mean motion: 15.613519 rev/day
Decay rate: 2.244500e-04 rev/day^2
Epoch rev: 3548

Hope this helps you solve the puzzle.

>the bright stroke of lightning moves up to the cloud. The current is
>about 10000 amps at its peak, and it carries down about 20 coulombs
>of negative charge.

Well forgive me for disagreeing with Dr. Feynman, but I have copies
of FAA sponsored field tests that disagree with the quoted description.
In simple form, the field tests showed that an extremely sharp point
generates a negative space charge around the rod for some distance by
continous low level corona discharge. The extreme sharpness is critical
because it allows the potential at the point to reach extreme values
when the average voltage is too low to ionize air. This negative charge
forms a barrier to the charge leaders attempting to complete a circuit.
Like charges repel. By preventing ionized leaders near the rod, the
frequency of lightning strikes is reduced. Special lightning dissipative
arrays that consist of many sharp points are available commercially for
this purpose. One such array is described in the NAB Engineering Handbook.
They *do* seem to work, even though my explanation sounds lame even to

me. I'll have to go back and read the Handbook again for details.

Dr. Feynman's explanation is correct for the normal, relatively blunt lightning rod. I believe that Ben Franklin came up with this description first. But the case I'm describing is for a much sharper point, like that on an atomic force microscope. This brings a different electrical effect, continous low level corona discharge, to the fore in the process. This was a very controversial topic in broadcast circles a few years ago, but it's now generally accepted that it really works.

I like the DX-100. It can be made very stable by triode
connecting the 6AU6 and placing the regulated 1 that normally
connects to the screen on both the screen and plate.

There are many, many modifications you can do to improve the
performance of the DX-100 and any other radio's of its time. Some
of the design in the Apache can be applied to the DX-100. Some of
it is worse!

I can be contacted at the address below if you desire any
modifications. I have quite a bit of experience with the DX-100
as I run one on the air.

If the inside of your DX-100 is very corroded, save yourself
a lot of headaches and clean everything up before you do anything else.

>Landwehr preamp?

I view a mast mounted preamp as expendable. Anything you do, other
than arranging the relays so it's disconnected from the circuit when
not in use and carefully bypassing any separate power feed, will likely
degrade the noise figure of your setup or be ineffective.

I put a gas discharge arrestor in the feedline at the base of the tower
to protect the rig in the shack and make sure the preamp is grounded
securely to the tower. I don't put an arrestor before the preamp because
it will degrade system noise figure and will likely be ineffective in
protecting the GASFET anyway.

I have a 17 foot dualband vertical above the satellite array and it
usually takes the strike. If the preamp is out of circuit, it usually
survives. If it's in, it's usually gone.

2297. HT for new ham

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-17 19:00:26 UTC
From: flinxwei@magnus.acs.ohio-state.edu
Message-ID: <1992May17.190026.2630@magnus.acs.ohio-state.edu>
Source record: 289858

Having recently passed my technician license, I am in the market for a new 2m rig. I have narrowed down my "field" to the following:

Radio Shack's HTX-202
or
Alinco's DJ-F1T

I like them both for various reasons. Now I want to get some "experienced voices" to let me know what to look for, and which is a better radio.

Please post or e-mail directly to me.

Thanks,
Eric Linxweiler

2298. Radar Detectors

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-17 19:14:54 UTC
From: fireman@wam.umd.edu
Message-ID: <1992May17.191454.28880@wam.umd.edu>
Source record: 289859

Question for the newsgroup:
I have a radar detector mounted in my car. When I go into Virginia and D.C.
I have noticed the signs that say that having such a device is illegal.
My question is, does my ham ticket give me any special privledges in this
area? I was told that since the radar detector receives radio transmissions
in the 10 GHZ range (where I beleive hams have privledges) that I could
consider my radar detector a "ham radio receiver" which would be exempt from
the law against "radar detectors". Am I crazy for beleiving that there might
be some truth in this argument?

>would somebody kindly summarize the kv4fz situation? from what i've seen
>so far, there is some matter of a ham defrauding a phone company. why should
>this receive so much attention here?

Well, you see, there are a lot of people who don't like kv4fz, and like
any average howling law-abiding mob, they'll dance at any chance to see
their bitter arch-enemy (whom they would imbue with the countenance of
the anti-christ) taken down in any way they can. Or burnt at the stake,
as may be.

Me, I don't even know who he is. But from the reactions on the net, I'm
led to believe he must have been Hitler's brother. Events like this are
why the rule of law must hold sway over the rule of men.

Date: 1992-05-17 21:28:35 UTC
From: VIDGAMES@biotechnet.COM
Message-ID: <920517172800.20201e77@biotechnet.com>
Source record: 289867

Andrew J. Greenshields N3IGS (dxandy@cs.widener.edu or
dxandy@cyber.widener.edu) says:
>I just got a 580 too and I am very impressed with it. I have used
>the airband and cellular telephone rx with no problems. It has all
>the features of other much more expensive radios. The only grouse I
>have is with the antenna, as with all rubber duckie antennas they are
>as about effective as a damp noodle.

Even Alinco's own rep. on CompuServe acknowledged that the antenna that
comes with the 580 is a bad antenna. He recommended getting another antenna
right off for effective transmit/receive.

SB DX @ ALLBBS $OPDX.061
Ohio/Penn DX Bulletin No. 61

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 061 (OPDX.061)
May 18, 1992
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, K4CEF & the Southeastern Cluster Group, ARRL, DXNL, DA1SC, DF4RD, OD5ZZ, KE2LJ, WK3N, WB3LHD, N4ZR, WA8MEM and K8YSE for the following DX information.

4U1WB, WORLD BANK. Pete, N4ZR, informs OPDX that he will be operating in the CQ WW WPX CW Contest (May 30-31) as 4U1WB, from the World Bank in Washington D.C. He will be active on 80-10 meters. For DXCC and contest purposes, the station counts as U.S.A. QSL to Pete Smith, N4ZR, 2003 Sarazen Pl., Reston, VA 22091.

4U7ITU, INTERNATIONAL TELECOMMUNICATIONS UNION, HQ. Kuno, DF1SD, and other operators take their turn to operate from here, May 28-31. They will be active mostly CW.

5B, CYPRUS. Ed, 5B4OG, has been very active on the WARC bands. Check 10104 kHz around 0130z, 18087 kHz around 0200z and 24893 kHz between 1230-1300z.

A5, BHUTAN. Erik, WZ6C/S2, has told Denny, GW3CDP, that there has been no operation from A5-land by anyone so far. All have been SLIMS. This would confirm what was reported by Jim, VK9NS, in last week's bulletin. The HA5BUS operators are enroute to 9M2-land and have not operated from A5.

C6, BAHAMAS. Horst, DL1FZ, is now active from Paradise Island signing /C6A thru June 1st on CW/SSB with some activity on the WARC bands.

D2, ANGOLA. A station signing N6QHO/D2 showed up May 17, on 28485 kHz around 1956z. The legitimacy and DXCC status of this station is unknown at this time. WFWL!

FR/G, GLORIOSO ISLANDS. Two German operators are now active from here: Baldur, FR/DJ6SI/G, and Willie, FR/DJ8CR/G. Baldur will operate CW while Willie operates SSB. For CW check 25 kHz up from the band edge and for SSB check 14224, 21295 and 21345 (NET) kHz. QSL to their home calls. Editor's Note: Glorioso Islands was ranked 17th in the OPDX/NODXA 1991

Most Wanted Countries List.

HB0, LIECHTENSTEIN. The Wiesbaden Amateur Radio Club will be signing HB0/DA1WA, May 22-31. This is their 17th annual HB0 DXpedition. Five stations will be active: 1 digital, 2 SSB, 1 CW and 1 CW/RTTY. Operations will be all bands including a possibility of a 6 meter operation during the hours of darkness. QSL via KN6G (North America), DJ0LC for all others, or DA1WA via bureau.

OD, LEBANON. A special event station will be active for one day June 1st to commemorate President Krami. The callsign will not be announced until that day. There will be a special QSL available for contacts. Activity will be on CW/SSB/RTTY, 20-10 meters and WARC bands.

WHO WAS ACTIVE THIS PAST WEEKEND ON RTTY? (5/16-17)
8P6SM 14084/1241z and 21083/1207z
A45ZX 14084/0130z
AM8ATE 21083/1333z (EA8)
CN8NP 14085/2038z *Editor's Note: Congratulations
GM0PGD 14088/0030z to Gin, JA1ACB, for being the
J88BS 14085/1200z and 21084/1655z first person to make mixed DXCC
RO4OA/UO5 14082/0350z Honor Roll with every contact
SV1BJV 21085/1245z made on RTTY.
TI2MCL 14083/1206z
UJ8JCQ 14082/0130z
VK4BR 14083/1144z
VQ9YA 14084/1992z
YI1BGD 21085/1224z
YS1SI 14082/1145z

SATELLITE DX. Stations heard lately on OSCAR-13: CT1DBS (QSL via BURO); V73BQ (via V73 BURO); OY9JD, FM5AB (via CBA); TA1D (via Kadri Basak, Box 1167, 34437 Istanbul, Turkey); J39GM (via Robbie Hage, Box 737, St. Georges, Grenada); H44KA (via KC9V); TL/FC1OMZ/P (via F2BJ); and 9M2CR (via CBA). Up coming activity: Look for C30/ON4ADC from July 15 to 31.

TM, CHAUSEY ISLAND. TM5CHA will be active May 22-29, both CW/SSB on 10 thru 80 meters. This station counts for France and has an IOTA of EU-39. QSL via F6BFH.

WAR QSLS. There were several NODXA members active from the Armed Forces Day station, WAR. John, K8YSE, one of the operators, informs OPDX that all contacts will be QSLed automatically if found in the HamCall DataBase dated April 1992.

XJ, CANADA. From June 29 thru July 12, there will be a special event station signing XJ3S to celebrate the 200th anniversary of the Niagara Falls Horseshoe.

XU, KAMPUCHEA. A station signing F6INF/4U showed up May 16, on 21033 kHz from 1700 to 1830z, claiming to be in XU-land. There is not much info on this station, so WFWL! QSL via FD1GTR.

YA5MM CARDS. The YA5MM cards are still being received in the mail and just a reminder that these cards are acceptable for DXCC credit.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

From: st355340@umbc2.umbc.edu
Message-ID: <18MAY92.00271014@umbc2.umbc.edu>
Source record: 289869

I have a Standard C128A 2m HT that is supposed to receive from 100MHz to 200 MHz, in both AM and FM modes. Yet, when I tune into anything on the FM broadcast bands 100-108 MHz, I get almost nothing, except for one channel (103.5 in the DC area) that is marginal. I thought it could be 1. the recieve is discriminating too narrowly for the width of each broadcast channel, or 2. the antennas (either the short coil or the 1/4 wave on my car) is way mismatched. Does anyone have a clue about receiving stations over a wide band receive?

IT V1.00 PATCH #2 AVAILABLE

HR AMSAT NEWS SERVICE BULLETIN 130.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 9, 1992 BID:$ANS-130.02
TO ALL RADIO AMATEURS BT

Patch To InstantTrack V1.00 Cures Possible Problem With Earlier Patch

Patch #2 to InstantTrack V1.00 is now available. This patch cures a bug
in Patch #1 to InstantTrack that could cause system crashes or causes other
unpredictable behavior when reading an ill-formatted NASA 2-line element
sets. Users who have installed Patch #1 are advised to install Patch #2
as soon as possible to avoid any problems.

Patch #2, like Patch #1 is designed to solve the problem created by the
recent change in NASA's computation of the checksum in its 2-line element
sets. NASA changed the value of the "+" sign from a "2" to a "0." Users
can work around this problem by replacing each "+" sign in the element set
files with a space. However, with Patch #2, this manual operation is not
necessary. The "patched" InstantTrack V1.00b will accept NASA format ele-
ment sets that use either checksum formula.

Patch #2 is available as ITPATCH2.ZIP or ITPAT2.ZIP on CompuServe's HamNet
forum and several landline BBS systems, including the AMSAT/DRIG BBS at
(214) 394-7438. Also, it is also available for "broadcast" download on AO-
16 and LO-19. INTERNET users can receive it via an "anonymous" FTP (File
```

Transfer Protocol) login from tomcat.gsfc.nasa.gov in the "public/amsat/itrack/" subdirectory as a file called itpatch2.zip. Patch #2 will soon be available from AMSAT-NA Headquarters. Please call AMSAT-NA at (301) 589-6062 for further details. Or if you wish, you can obtain it directly from the creator of the ITPATCH2.EXE directly by writing to:

Paul Williamson, KB5MU
5331 Channing Street
San Diego, CA 92117

If you expect a postal response from KB5MU, please include an SASE. If you expect a diskette in response, please send it formatted in a reuseable mailer with sufficient return postage. If you have questions about IT-PATCH2.EXE, you can contact KB5MU in the following ways:

AMSAT Mid-West Conference Set For June 13th At Purdue University

Dick Shiller (K4BQH) and Dave Filmer (WB9QPG) have organized an AMSAT Mid-West Conference to be held at Purdue University in West Lafayette, Indiana on June 13th. All radio amateurs are invited to attend this conference. The following is the agenda and topics of discussion.

PROGRAM

8:00-9:00 Registration

8:30-9:00 Preliminary meeting of all Area Coordinators and Regional Coordinators. Ron Pogue (KD9QB) to chair the meeting

9:00-9:45 "Developing a Satellite Tracking Program"
Roy Welch (W0SL)

9:45-10:30 "Building and Operating the TRAKBOX"
Leo Schaaf (KD8SI)

COFFEE BREAK

10:45-11:30 "Controlling AO-16 and the CSDP Program"
Bruce Rahn (WB9ANQ)

11:30-12:15 "Pacsat Gateways - Background and Operation"
Dave Daley (NU9H)

LUNCH

1:15-2:00 "Evolution of Amateur Satellite Telemetry"
Gould Smith (WA4SXM)

2:00-2:30 Question and Answer Period. Second Meeting of
Area Coordinators (if necessary)

COFFEE BREAK

2:45-3:30 "Digital Conversion of Medical Images and
Transmission by Amateur Packet Radio"
Ron Pogue (KD9QB) and Jon Haskell (KB9CML)

3:30-4:15 "Amateur DSP Today"
David L. Filmer, WB9QPG

4:25-5:00 Demonstration of Photographs and Pictures Downloaded
from UO-14/22

For information about local lodging and other aspects of the arrangements,

SILVER SPRING, MD MAY 9, 1992 BID:$ANS-130.04
TO ALL RADIO AMATEURS BT

AMSAT-UK Sponsors 7th Annual Satellite Colloquium at UoS

AMSAT-UK is sponsoring a symposium focused on all OSCAR satellites and dig-
ital communications. Questions & Answer sessions with various Amateur
Satellite experts are planned. As in years past, the University of Surrey
will be the meeting place for this Colloquium. The following is the pre-
liminary "line-up" of programs planned for the week of July 30 - August 2:

Thursday July 30th: International Satellite Day
Friday July 31th: Satellite Sessions
Saturday August 1st: Satellite Sessions
Sunday August 2nd: Satellite Sessions

Overseas members can arrive on Wednesday and leave on Monday morning if they wish. The POSH Restaurant and Bar is going to be used for the Saturday Night "shindig." Ron wonders if the "Junk Sale" Saturday night is the the right thing to do. Send your wish list to Ron at his address below. Also, Ron Broadbent advises that any papers for Colloquium '92 MUST be in his hands by the 10th of June.

For more details on the Symposium, contact:

Ron Broadbent, G3AAJ
94 Herongate Road
Wanstead Park
London E12 5EQ England

Tel: 081-989-6741 (9:30 - 18:30 British Time daily)
Fax: 081-989-3430 (24 Hours)

[The AMSAT News Service (ANS) would like to thank AMSAT-UK for the information which went into this bulletin.]

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 130.05 FROM AMSAT HQ
SILVER SPRING, MD MAY 9, 1992 BID:$ANS-130.05
TO ALL RADIO AMATEURS BT

AO-13 ZRO Test Schedule: May 1992

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule for May, 1992, via AO-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero." The control operator will send and repeat a random five-digit number, then lower the uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine").

A participating listener monitors the downlink signals until they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9).

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz. Ed (N5EM) will run the "JL" tests while Andy (WA5ZIB) will continue with "B" runs.

Saturday May 16, 1992 at 0120 UTC "JL"
Saturday May 23, 1992 at 0500 UTC "JL"

Sunday May 24, 1992 at 0400 UTC "B"
Saturday May 30, 1992 at 1745 UTC "B"
Saturday May 30, 1992 at 2000 UTC "JL"

Note that the dates and days are shown in "UTC", thus the test on May 16th occurs on Friday night for those in North America. The same situation is true for the tests on May 23rd and May 24th. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure characterizes test procedures, means for obtaining certificates and gives some historical background about the program. A few certificate requests from the previous round of ZRO tests are still pending but should be shipped by May 9th.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception.

TO ALL RADIO AMATEURS BT

All AMSAT-NA Electronic Mail To Move Through CompuServe & INTERNET

Next week a new milestone in AMSAT's use of electronic mail will be reached when, beginning May 31, all of its internal business communications will be conducted using CompuServe Information Service (CIS) and INTERNET. For the past seven years, most of the communications between the AMSAT Board-of-Directors (BOD), Ground Command Stations, AMSAT-NA Officers, and between various AMSAT groups around the world were accomplished using "Sprint Mail" or as it was also sometimes referred to, "TeleMail." But because of the enormous expense of "Sprint Mail," the AMSAT-NA BOD decided it was time to switch to a less costly approach to communications. By migrating to CompuServe and INTERNET, the BOD estimates that AMSAT-NA will save about $25,000 per year. The immediate benefit of this change to CompuServe and INTERNET is that the AMSAT membership now have a much more open access to the BOD, Officers, Area Coordinators, and many of the hams who play a vital role in keeping OSCAR satellites working. Most of these individuals can be contacted through CompuServe or an INTERNET connection. For example, if you would like to send an electronic mail message to AMSAT-NA President Bill Tynan (W3XO), he can be reached at his CompuServe address of 70323,2750. Or, if you have access to an INTERNET "node," you can send Bill a message to his INTERNET address of w3xo@amsat.org. Either way you send your message, Bill will get your "mail." If you would like to have a complete list of all individuals in the AMSAT organization which are on CompuServe or INTERNET, you can send Tom Clark (W3IWI) a request for this

list via either CompuServe or INTERNET to w3iwi@amsat.org. By doing so he will send you the AMSAT-NA "address book." Included in this list are "special interest" groups that deal with, for example, the PHASE-3D design, AMSAT Area Coordinators, and those who publish the keplerian elements and the AMSAT News Service (ANS) bulletins.

For those who are on CompuServe and have never sent a message to a anyone on INTERNET, it is quite easy. When you compose your "mail" message on CompuServe and it "prompts" you for the address, in the case of Tom Clark (W3IWI) for example, you would type his INTERNET address as follows:

>INTERNET:w3iwi@amsat.org (NOTE the UPPER & lower case)

and on if you are on INTERNET and you want to send Tom a message, you address it to him by typing: w3iwi@amsat.org.

The AMSAT BOD hopes that this use of CompuServe and INTERNET will provide a vehicle for a more open exchange of ideas and make information more accessable to all OSCAR satellite enthusiasts.

W3GEY HAS RESIGNED AS VP ENG

HR AMSAT NEWS SERVICE BULLETIN 137.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 16, 1992 BID:$ANS-137.02
TO ALL RADIO AMATEURS BT

AMSAT-NA VP For Engineering, Jan KIng (W3GEY), Resigns Position

AMSAT-NA regrets to announce the resignation of Jan A. King (W3GEY) as Vice President for Engineering. Jan's resignation came rather suddenly earlier this week, citing principally work related pressures and commitments, as well as family responsibilities. Jan emphasized that he remains a loyal AMSAT member and, in fact, intends to spend, whatever amateur radio time he has, in becoming active on AO-10/13. Jan further indicated that he may serve out his remaining time on the Board of Directors, although he said that he will not have the time to be as active in Board affairs as he has been.

As many old timers in the organization know, Jan King was one of the founders of The Radio Amateur Satellite Corporation in 1969 and has held the post of VP Engineering since it was created. As such, he was instrumental in guiding the organization's technical activities from Australis OSCAR 5 through the MICROSATS as well as the early planning stages of Phase 3D.

AMSAT-NA President Bill Tynan (W3XO) expressed disappointment at W3GEY's announcement but said that he understood the circumstances. He stressed, however, that the loss of Jan's talents must not, and will not, inhibit AMSAT-NA from meeting its commitments to the worldwide Phase 3D project. He indicated that he is presently reviewing a list of potential candidates for the post of VP Engineering. In the meantime, Bob McGwier (N4HY), who

had previously said that he would be unable to go to Marburg for the Phase 3D Experimenters Meeting later this month because of work conflicts, has now indicated that he will be able to attend. As a result, Bob will be among those representing AMSAT-NA at this vital meeting. Others going include Dick Daniels (W4PUJ) Phase 3D Project Manager for AMSAT-NA's role in Phase 3D and Dick Jansson (WD4FAB) who has been very active in both structural design of the spacecraft as well as some preliminary antenna work. Both N4HY and WD4FAB currently hold the title of Assistant Vice President for Engineering.

W3XO expressed the hope that AMSAT will be able to call on Jan King for technical or other assistance in the years to come and wishes him well in both his amateur and professional pursuits.

ZRO TEST SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 137.03 FROM AMSAT HQ
SILVER SPRING, MD MAY 16, 1992 BID:$ANS-137.03
TO ALL RADIO AMATEURS BT

AO-13 ZRO Test Schedule: May 1992

The ZRO Memorial Technical Achievement Award Program, or just "ZRO Test" has a new schedule for May, 1992, via AO-13. This activity is a test of operating skill and equipment performance.

During a typical ZRO run, a control station will send numeric code groups using CW at 10 words-per-minute. At the beginning of the run, uplink power from the control station is set to match the general beacon downlink strength. This is level "zero." The control operator will send and repeat a random five-digit number, then lower the uplink power by 3 dB (half power) and repeat the procedure with a new random number. This will continue to a level 27 dB below the beacon (level "nine").

A participating listener monitors the downlink signals until they can no longer copy the numbers. Those who can hear the beacon will qualify for the basic award by copying the code group heard at level "zero". The challenge is to improve home-station performance to a point where the lower-level downlink signals can be copied (levels 6 through 9).

The following schedule of Mode "B" and "JL" ZRO tests were chosen for convenient operating times and favorable squint angles. The "B" tests can be heard on 145.840 MHz and the "JL" test on 435.945 MHz. Ed (N5EM) will run the "JL" tests while Andy (WA5ZIB) will continue with "B" runs.
Saturday May 23, 1992 at 0500 UTC "JL"
Sunday May 24, 1992 at 0400 UTC "B"
Saturday May 30, 1992 at 1745 UTC "B"
Saturday May 30, 1992 at 2000 UTC "JL"

Note that the dates and days are shown in "UTC", thus the test on May 16th occurs on Friday night for those in North America. The same situation is

true for the tests on May 23rd and May 24th. Any changes will be announced as soon as possible via the AMSAT HF and AO-13 Operations Nets.

Recently updated ZRO brochures are available from WA5ZIB, Andy MacAllister, AMSAT V.P. User Operations, 14714 Knightsway Drive, Houston, TX 77083 for an S.A.S.E. with two units of postage. The brochure characterizes test procedures, means for obtaining certificates and gives some historical background about the program. A few certificate requests from the previous round of ZRO tests are still pending but should be shipped by May 9th.

All listener reports with date of test and numbers copied should be sent to WA5ZIB at the address above. A report will be returned verifying the level of accurate reception.

Calendar of events for Oscar-13 to the end of 1992

Suns Position
Date Event Modes Sun Angle SEL/SAZ

1992 Jun 08 [Mon] Move to 210/0 B JL S 5 -24/126
1992 Jun 29 [Mon] L OFF B -- - 4 -33/149
1992 Jul 20 [Mon] Move to 150/0* B -- - 3 to 44 -34/176
1992 Aug 17 [Mon] L ON B JL S 28 -26/208
1992 Sep 21 [Mon] Move to 180/0 B JL S -1 to 29 -2/241
1992 Nov 23 [Mon] Move to 210/0 B JL S -29 to -4 33/305
1992 Dec 14 [Mon] L OFF B -- - -27 33/333
1992 Dec 28 [Mon] t.b.a. 43 29/351

Notes:
1. * via Alon/Alat 180/15; expect poor performance for a few days.
2. Illumination = 100*Cos(Sun_Angle) % and needs to be better than
70%, i.e. Sun angle within +/- 45 deg.

3. SEL/SAZ is Sun's position in orbit plane (like ALAT/ALON). Move on
Jul 20 to 150/0 is because Sun is at SAZ=176 i.e. apogee direction
so the antennas cannot point there as the solar panels would not
be illuminated. The Sun then gradually moves to SAZ around 208 so
we cannot use attitude 210/0 as has been customary.

AO-13 Transponder Schedule Jun 10 - Jul 20

Mode-B : MA 000 to MA 165 ! Mode-JL on Mon, Wed
Mode-JL : MA 165 to MA 200 ! Fri and Sat UTC.
Mode-LS : MA 200 to MA 215 ! S Beacon on "L" days
Mode-B : MA 215 to MA 256 ! S Transp on "B" days
Omnis : MA 250 to MA 060 ! ALON/ALAT 210/0

Mode L OFF after Jun 29 until Aug 17. Next attitude change Jul 20,
to 150/0 until Sep 21.

Note that modes will only change at the above MAs. So if Mode-L has
hung over through midnight utc into a non-L day, it will switch off
at any subsequent scheduled MA change point.

Similarly if midnight UTC begins a Mode-L day, the L transponder will
switch on at any subsequent scheduled MA change point, if appropriate.

INFORMATION

Don't rely on gossip and rumour! Up to date information about AO-13
operations is always available on the beacons, 145.812 MHz or 435.658 MHz
in CW, RTTY and 400 bps PSK. The active command stations are listed
below, and constructive feedback about operations is always welcome.

AO-16 Experimenter's Day Schedule

The AO-16 Command Team has announced the following PACSAT Experimenter's
Day schedule for April and May:

DATE START TIME END TIME MODE

20 May 0310 UTC - 20 May 0245 UTC - 21 May RCO
27 May 0625 UTC - 27 May 0600 UTC - 28 May RCO

RCO: Raised Cosine Only, No S-Band.

QRP operations are encouraged on Experimenter's Day. Uplink power should
be limited to 20 watts EIRP. If you are using your AO-10/13 beams, this
means you must crank your power back to about as low as it will probably
go, no more than 2 watts. And don't forget to turn off your amplifier!

While Experimenter's Day operations are scheduled to be conducted weekly,
users are reminded that these operations may be shortened or canceled to
allow uploading of improved spacecraft software. Watch for bulletins on
the AO-16 BBS and/or the telemetry text frame for changes to the schedule.

2310. New Callsigns

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 03:06:36 UTC
From: dxandy@cs.widener.edu
Message-ID: <v76vsINN6qt@ashley.cs.widener.edu>
Source record: 289875

I was using a local repeater the other day with a couple of fellow hams when we were joined by another person who said he was a new ham. What puzzled me was his call, it was N3B** (I don't want identify him). I thought that was a fairly old call for a new ham, so I looked it up in the online call book at buffalo and there was no reference. I didn't think that it was appropriate to voice my suspicion on the air that he might be a pirate. He seemed like a decent enough character.

Anyway, my question is... Is the FCC issuing 'old' calls and if not, why was this call not listed in the callbook?

>occasionally hear is understandably obnoxious to them. If this were a more
>conventional machine, I think the interference would be better tolerated.

I assume you mean that they listen to a silent frequency, and are called
to attention to what turns out to be adjacent channel cross talk. I am
also assuming that when both repeaters are transmitting there is not any
interference.

Perhaps some of the radios receiving the DX repeater are off frequence or
are too wide.

The best solution I can think of is CTCSS out on the DX repeater and let
the listeners use CTCSS squelch.

2313. Re: Itinerant Frequencies in 450-470 Mkz Range???

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 04:23:13 UTC
From: zbang@access.digex.com
Message-ID: <1992May18.042313.9314@access.digex.com>
Source record: 289772

In article <3691@gdls.UUCP> turini@gdls.UUCP (CSC @ GDLS) writes:
>I recently got a copy of a catalog from a scanner sales company and noticed
>that they were offering VHF radios that had one or two frequencies in them
>that they referred to "itinerant frequencies". I believe that they were in
>the 151.xxx Mhz range. They went on to say that one needed to be licensed to
>use these frequencies, but an application came with the radio.
>
>I have never heard of this, and was curious if anyone on the net could
>explain this. Are there analagous frequencies in the 450-470 Mhz range?
>Or anywhere else?

You, of course, know that any use of the radio spectrum must be licensed,
with certain exceptions. Well, in the commercial radio services, all
frequency assignments are coordinated by various organizations to
attempt to minimize interference. This coordination is based on
desired coverage area, power requested, number of units, and type of
business, and the coordinator actually assigns the freq. There are
different coordinators for most of the different radio services listed,
(FCC part 90) Power Utility, Railroad, Industrial Business, Forestry,
etc., and different channel allocations.

The exception in the so called itenerant freqs. They are licensed with
certain restrictions on power and type of units, but do not carry any
attempt to prevent users from stepping on each other. It's up to the users
to resolve "differences" in channel usage, same as in the amature radio
service.

My license states that I can use any of the four freqs below, anywhere
in the US between lines "A" and "C" (some number of miles from the Canadian
and Mexican bordors). If someone else wants to use the same channel, they
are allowed as long as they don't intentionally interfere with my usage.

And, as in the ham arena, there are some who abuse/ignore the rules. In
the past, some shops have sold itinerants and promised exclusive usage.
There are users who feel that they are a more important users than
you are. There are also users who aren't licensed at all.

The UHF itenerants are 464.500, 464.550, 469.550, and 469.550. Repeater
operation may be licensed, with 5.00MHz offset.

I hope this helps,

Carl Zwanzig WNRL354
zbang@access.diges.com

2314. Which U.S. Navy station is "NCP"?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 05:30:49 UTC
From: winter@apple.com
Message-ID: <67251@apple.Apple.COM>
Source record: 289683
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave,sci.space.shuttle

While listening to NASA Select coverage of the Intelsat rescue last Wednesday, a couple of times, for several minutes each, I heard the Morse code identifier "NCP" coming through on the audio feed. It seemed to happen while the shuttle was over the eastern Indian Ocean or western Pacific Ocean.

Given that three-letter N calls typically belong to U.S. Navy facilities, does anyone know where NCP is? My best guess is the Philippines. And wherever it is, why was it audible on NASA Select? Was it being used as a shuttle-to-Houston relay station?

Patty

```
Observed at station 50.7 NLat, 7.1 ELon, MAY 16, 1992

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 ON again
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 On
METEOR 2-20: APT 137.85 On, NO SYNCH
METEOR 3-3: APT 137.40 On
METEOR 3-4: APT 137.30 ** SEE BELOW **

METEOR 3-4 was quiet during orbit # 5108 over europe
at least between 0640 UT and 0656 UT. APT on 137.30 MHz
was heard 1025 UT matching METEOR 3-4 orbit # 5110.
APT on 137.30 MHz was heard 1630 UT matching METEOR 3-5
orbit # 3623 (predicted 1614-1630 UT), not matching
METEOR 3-4. A full pass of METEOR 3-4 was copied MAY 17
1550 UT until 1602 UT when the APT-carrier switched off,
instead of switching from vis to IR. This was orbit
# 5126 descending slightly east of Moscow. The Satellite
was over 47 NLat, 43 ELon when turning off.
NOAA-10 is on again after end of VHF-conflict with NOAA-12
since MAY 15.
METEOR 2-20 continues to transmit only the (very good)
image without synch, greyscale and digital data.

2317. Dish positioner ?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 08:26:25 UTC
From: michaeln@hpcvnb.CV.HP.COM
Message-ID: <61250003@hpcvnb.CV.HP.COM>
Source record: 289743

I have a question for the net. Does anyone know how/or know anyone who has built a rotor system for a 12 foot dish for 360 degree asmath (sp) and at least 90 degree elevation? Some how I don't think a HD73 rotor with a KR500 elevation rotor is going to do the trick. I'd like to set a tvro dish up to work the oscars and if someone has done this successfully I'd rather not re-invent the wheel so to speak.
If anyone has any info, either e-mail or post to the net. If I get anything interesting I'll post it back anyway. Thanks, Mike Nason KA7HBB.

2318. Some calls needed

Newsgroup: rec.radio.amateur.misc

2319. Radios in a Volvo?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 12:05:12 UTC
From: RPATTERS%KENTVM.BITNET@sds.sdsc.edu
Message-ID: <920518120421.20200188@Sdsc.Edu>
Source record: 289733

With all the discussion, here and elsewhere about problems with radios in various vehicles (like the Camry--wow I'm glad I didn't buy one of those!!), my questions: I'm considering buying a Volvo 940. Any problems with these cars? I'll do a good install job--good shielded cable (not RG58); antenna mtg in the rear away; good grounds throughout. But, any experiences, suggestions otherwise?

2320. MODS NEEDED FOR RADIO SHACK HXT-202 HT

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 12:08:34 UTC
From: lee@lonex.rl.af.mil
Message-ID: <1992May18.120834.28829@lonex.rl.af.mil>
Source record: 289734

I have the Radio Shack hand held 2m handie talkie HTX-202. Are there any mods that will open up the receive portion of the rig to receive public service up to say 165Mhz. Any FTP sites or info would be helpful.

Thanks in advance
Lee

2321. Re: Help with NOAA Weather Frequencies

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 12:50:35 UTC
From: ken@swbatl.sbc.com
Message-ID: <1992May18.125035.19647@swbatl.sbc.com>
Source record: 289767

>My Icom IC-M2 (marine hand-held) manual lists the following weather channels:
>WX1 162.550
>WX2 162.400
>WX3 162.475
>WX4 161.650 (marine channel 21B - used by Canadian Coast Guard for b'casts.)

>I also have an Icom IC-M55 which allows you to select weather channels 1 - 10,
>but only the 4 listed above are active, I believe (the manual is on my boat).

>Peter Bennett VE7CEI Bitnet: bennett@triumfer
>TRIUMF, Vancouver, B.C., Canada Internet: bennett@erich.triumf.ca

I think maybe you've answered my question. With someplace to start,
I was able to determine the frequencies of the three undocumented
channels on my radio. They are 161.650, 161.775 and 163.275MHz.
As soon as I find a listing of VHF maritime channels, I'll check
these out.
-Ken WB0QNA

2322. ARRL Hudson Division Convention / Hamfest

1992 ARRL HUDSON DIVISION CONVENTION

co-sponsored by

Bergen Amateur Radio Association (B.A.R.A.)
Radio Amateur Telecommunications Society (R.A.T.S.)
Hudson Amateur Radio Council (H.A.R.C.)

Saturday June 6, 1992
7:00 AM till 4:00 PM
Rain or Shine

To be held at:

FARLEIGH DICKINSON UNIVERSITY
Teaneck, New Jersey
Featuring
Amateur Testing
Novice thru extra
8:00 AM to 10:00 AM Only
Exam information - contact Pete K2MHP (201) 796-6622
(No calls after 10 PM)

Bring Original FCC License and a photo-copy
VEC charge $5.25

ARRL and FCC Forums

Technical Seminars

HAMFEST

Food and Snacks

$5.00 ADMISSION

.Children under 12 FREE
.Lots of Parking
.Rest Room Facilities
.Refreshments
Vendor Space

. $30 per indoor space
.$25 per outdoor space with power provided
.$10 outdoor tailgating space

Talk-in on 146.19/79 & 146.52 simplex

For vending space reservations and Hamfest Information -
contact Jim Joyce K2ZO (201) 664-6725
(No calls after 10 PM)
286 Ridgewood Blvd. No.
Washington Twp., N.J. 07675

Directions:

From the West....

Take Garden State Parkway to exit 161 (Route 4 EAST).
Take route 4 East to RIVER ROAD - FARLEIGH DICKINSON exit.
follow signs to parking area.

From NYC ....

Take George Washington Bridge to N.J.
take Route 4 West to RIVER ROAD - FARLEIGH DICKINSON exit.
follow signs to parking area.

2323. Re: Inter-repeater Interference

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 13:55:18 UTC
From: abeals@catnip.berkeley.ca.us
Message-ID: <5490@catnip.berkeley.ca.us>
Source record: 289735

jweiss@casbah.acns.nwu.edu (Jerry Weiss) writes:

>Unfortunately there is another repeater in the area 15 Khz below, but
>somewhat farther away. What Greg didn't mention is the repeater at 147.36
>is a closed DX repeater. The users are of the type that listen
>breathlessly for any traffic on their channel. The crosstalk they
>occasionally hear is understandably obnoxious to them. If this were a more
>conventional machine, I think the interference would be better tolerated.

Gee, sounds like the closed DX repeater should start transmitting a CTCSS
tone and its members should enable the CTCSS decode on their radios...
but that's a technological solution to a social problem [grumps that
don't like being disturbed] and as such, it will never work. They'd
have to learn how to use their radios...or worse yet, upgrade from
their IC-2ATs...

2324. Re: Lighting protection for antenna?

Newsgroup: rec.radio.amateur.misc
Date: 1992-05-18 14:45:45 UTC
From: whester@isis.cs.du.edu
Message-ID: <1992May18.144545.12916@mnemosyne.cs.du.edu>
Source record: 289737

As a tangent to this discussion, has anyone had any experiences with the use of ionizing types of lightning protection systems?

These differ from the traditional Franklen (U.L. Master Label listing) rod and downlead systems, as well as the newer multi-point dissipation arrays.

The ionizing types use a method to provide a "bubble" of ionized air around the air terminal. The air terminal uses either a radioactive source (which presents licensing and disposal problems) or utilizes a method to generate a high voltage between sharp electrodes on the air terminal (such as the Prevectron unit from France).

We are currently trying out a couple of the Prevectron units at my work... so far so good...but how does one really "test" such devices in the field?

Regards, Bill, N0LAJ
